

# Preface

*Web Development and Design Foundations with HTML5* is intended for use in a beginning web development course. This textbook introduces HTML and CSS topics such as text configuration, color configuration, and page layout, with an enhanced focus on the topics of design, accessibility, and Web standards. The text covers the basics that web developers need to build a foundation of skills:

- Internet concepts
- Creating web pages with HTML5
- Configuring text, color, and page layout with Cascading Style Sheets (CSS)
- Web design best practices
- Accessibility standards
- The web development process
- Using media and interactivity on web pages
- New CSS3 properties
- Website promotion and search engine optimization
- E-commerce and the Web
- JavaScript

A special feature of this text is the *Web Developer's Handbook*, which is a collection of appendixes that provide resources such as an HTML5 Reference, Comparison of XHTML and HTML5, Special Entity Character List, CSS Property Reference, WCAG 2.0 Quick Reference, FTP Tutorial, and web-safe color palette.

## New to This Edition

Building on this textbook's successful eighth edition, new features for the ninth edition include the following:

- Updated coverage of HTML5 elements and attributes
- Expanded coverage of designing for mobile devices
- Updates for HTML5.1 elements and attributes
- Expanded coverage of responsive web design techniques and CSS media queries
- Updated code samples, case studies, and web resources
- An introduction to CSS Grid Layout
- Updated reference sections for HTML5 and CSS
- Additional Hands-On Practice exercises

Student files are available for download from the companion website for this textbook at [www.pearson.com/cs-resources](http://www.pearson.com/cs-resources). These files include solutions to the Hands-On Practice exercises, the Website Case Study starter files, and access to the book's companion VideoNotes. See the access card in the front of this textbook for further instructions.

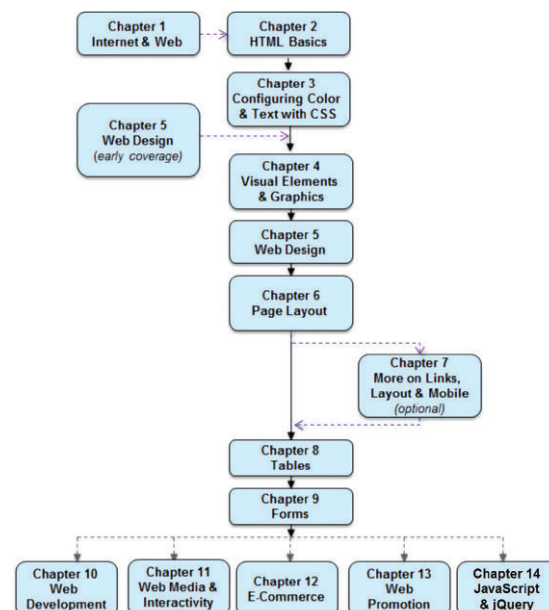

## Design for Today and Tomorrow

This textbook has a modern approach that prepares students to design web pages that work today, in addition to being ready to take advantage of the new HTML5 and CSS coding techniques of the future.

## Organization of the Text

This textbook is designed to be used in a flexible manner; it can easily be adapted to suit a variety of course and student needs. Chapter 1 provides introductory material, which may be skipped or covered, depending on the background of the students. Chapters 2 through 4 introduce HTML and CSS coding. Chapter 5 discusses web design best practices and can be covered anytime after Chapter 3 (or even along with Chapter 3). Chapters 6 through 9 continue with HTML and CSS.

Any of the following chapters may be skipped or assigned as independent study, depending on time constraints and student needs: Chapter 7 (More on Links, Layout, and Mobile), Chapter 10 (Web Development), Chapter 11 (Web Multimedia and Interactivity), Chapter 12 (E-Commerce Overview), Chapter 13 (Web Promotion), and Chapter 14 (A Brief Look at JavaScript and jQuery). A chapter dependency chart is shown in Figure P.1.

**Figure P.1** This textbook is flexible and can be adapted to individual needs

## Brief Overview of Each Chapter

**Chapter 1: Introduction to the Internet and World Wide Web** This brief introduction covers the terms and concepts related to the Internet and the Web with which Web developers need to be familiar. For many students, some of this will be a review. Chapter 1 provides the base of knowledge on which the rest of the textbook is built.

**Chapter 2: HTML Basics** As HTML5 is introduced, examples and exercises encourage students to create sample pages and gain useful experience. Solution pages for the Hands-On Practice are available in the student files.

**Chapter 3: Configuring Color and Text with CSS** The technique of using Cascading Style Sheets to configure the color and text on web pages is introduced. Students are encouraged to create sample pages as they read through the text. Solutions for the Hands-On Practice are available in the student files.

**Chapter 4: Visual Elements and Graphics** This chapter discusses the use of graphics and visual effects on web pages, including image optimization, CSS borders, CSS image backgrounds, new CSS3 visual effects, and new HTML5 elements. Students are encouraged to create web pages as they read through the text. Sample solutions for the Hands-On Practice are available in the student files.

**Chapter 5: Web Design** This chapter focuses on recommended web design practices and accessibility. Some of this is reinforcement because tips about recommended website design practices are incorporated into the other chapters.

**Chapter 6: Page Layout** This chapter continues the study of CSS begun earlier and introduces techniques for positioning and floating web page elements, including a two-column CSS page layout. New HTML5 semantic elements and techniques to provide HTML5 compatibility for older browsers are also introduced. Sample solutions for the Hands-On Practice are available in the student files.

**Chapter 7: More on Links, Layout, and Mobile** This chapter revisits earlier topics and introduces more advanced techniques related to hyperlinks, using CSS sprites, a three-column page layout, configuring CSS for print, designing pages for the mobile web, responsive web design with CSS media queries, responsive images, the new Flexible Box Layout Module, and the new CSS Grid Layout Module. Students are encouraged to create pages as they read through the text. Sample solutions for the Hands-On Practice are available in the student files.

**Chapter 8: Tables** This chapter focuses on the HTML elements used to create tables. Methods for configuring a table with CSS are introduced. Students are encouraged to create pages as they read through the text. Sample solutions for the Hands-On Practice are available in the student files.

**Chapter 9: Forms** This chapter focuses on the HTML elements used to create forms. Methods for configuring the form with CSS are introduced. New HTML5 form control elements and attribute values are introduced. Students are encouraged to create sample pages as they read through the text. Sample solutions for the Hands-On Practice are available in the student files.

**Chapter 10: Web Development** This chapter focuses on the process of website development, including the job roles needed for a large-scale project, the web development process, and web hosting. A web host checklist is included in this chapter.

**Chapter 11: Web Multimedia and Interactivity** This chapter offers an overview of topics related to adding media and interactivity to web pages. These topics include HTML5 video and audio, Flash®, Java™ applets, CSS3 transform and transition properties, interactive CSS menu, interactive image gallery, JavaScript, jQuery, Ajax, and HTML5 APIs. Students are encouraged to create pages as the topics are discussed. Sample solutions for the Hands-On Practice are available in the student files.

**Chapter 12: E-Commerce Overview** This chapter introduces e-commerce, security, and order processing on the Web.

**Chapter 13: Web Promotion** This chapter discusses site promotion from the web developer's point of view and introduces search engine optimization.

**Chapter 14: A Brief Look at JavaScript and jQuery** This chapter provides an introduction to client-side scripting using JavaScript and jQuery. Sample solutions for the Hands-On Practice are available in the student files.

**Web Developer's Handbook Appendixes:** This handbook contains appendixes that include resources and tutorials that are useful for students, such as an HTML5 Quick Reference, Special Entity Characters, a Comparison of XHTML and HTML5, a CSS Property Reference, a WCAG 2.0 Quick Reference, an FTP Tutorial, and a web-safe color palette.

## Features of the Text

**Well-Rounded Selection of Topics** This text includes both “hard” skills such as HTML5, CSS, and JavaScript (Chapters 2, 3, 4, 6, 7, 8, 9, and 14) and “soft” skills such as web design (Chapter 5), website promotion (Chapter 13), and e-commerce (Chapter 12). This well-rounded foundation will help students as they pursue careers as web professionals. Students and instructors will find classes more interesting because they can discuss, integrate, and apply both hard and soft skills as students create web pages and websites.

**Hands-On Practice** Web development is a skill and skills are best learned by hands-on practice. This text emphasizes hands-on practice through exercises within the chapters, end-of-chapter exercises, and the development of websites through ongoing real-world case studies. The variety of exercises provides instructors with a choice of assignments for a particular course or semester.

**Website Case Studies** There are four case studies that continue throughout most of the text (starting with Chapter 2). An additional case study starts in Chapter 5. The case studies serve to reinforce the skills discussed in each chapter. Instructors can cycle assignments from semester to semester or allow students to choose the case study that most interests them. Sample solutions to the case studies are available for download from the Instructor Resource Center at [www.pearson.com](http://www.pearson.com).

**Web Research** Each chapter offers web research activities that encourage students to further study the topics introduced in the chapter.

**Focus on Web Design** Most chapters offer additional activities that explore the web design topics related to the chapter. These activities can be used to reinforce, extend, and enhance the course topics.

**FAQs** In the author's web development courses, she is frequently asked similar questions by students. They are included in this textbook and are marked with the identifying FAQ logo.

**Checkpoints** Each chapter contains two or three Checkpoints, which are groups of questions to be used by students to self-assess their understanding of the material. A special Checkpoint icon appears with each group of questions.

**Focus on Accessibility** Developing accessible websites is more important than ever and this textbook is infused with accessibility techniques throughout. The special icon shown here makes accessibility information easy to find.

**Focus on Ethics** Ethics issues related to web development are highlighted throughout the textbook and are marked with the special ethics icon shown here.

**Reference Materials** The appendixes in the *Web Developer's Handbook* offer reference materials, including an HTML5 Quick Reference, Special Entity Characters, Comparison of XHTML and HTML5, a CSS Property Reference, a WCAG 2.0 Quick Reference, an FTP Tutorial, an introduction to ARIA Landmark Roles, and a Web-Safe Color Palette.

**VideoNotes** These short step-by-step videos demonstrate how to solve problems from design through coding. VideoNotes allow for self-placed instruction with easy navigation including the ability to select, play, rewind, fast-forward, and stop within each VideoNote exercise.

Margin icons in your textbook let you know when a VideoNote video is available for a particular concept or homework problem.

**Focus on  
Accessibility**

**Focus on  
Ethics**

**VideoNote**

## Supplemental Materials

**Student Resources** The student files for the web page exercises, Website Case Study assignments, and access to the book's VideoNotes are available to all readers of this textbook at its companion website [www.pearson.com/cs-resources](http://www.pearson.com/cs-resources). A complimentary access code for the companion website is available with a new copy of this textbook. Subscriptions may also be purchased online.

**Instructor Resources** The following supplements are available to qualified instructors only. Visit the Pearson Instructor Resource Center ([www.pearson.com](http://www.pearson.com)) for information on how to access them:

- Solutions to the end-of-chapter exercises
- Solutions for the case study assignments

- Test questions
- PowerPoint® presentations
- Sample syllabi

**Author's Website** In addition to the publisher's companion website for this textbook, the author maintains a website at <http://www.webdevfoundations.net>. This website contains additional resources, including review activities and a page for each chapter with examples, links, and updates. This website is not supported by the publisher.

## Acknowledgments

Very special thanks go to all the folks at Pearson, especially Michael Hirsch, Matt Goldstein, Erin Ault, and Lora Friedenthal.

Thank you to the following people who provided comments and suggestions that were useful for this ninth edition and previous editions:

Carolyn Andres—*Richland College*  
 James Bell—*Central Virginia Community College*  
 Ross Beveridge—*Colorado State University*  
 Karmen Blake—*Spokane Community College*  
 Jim Buchan—*College of the Ozarks*  
 Dan Dao—*Richland College*  
 Joyce M. Dick—*Northeast Iowa Community College*  
 Elizabeth Drake—*Santa Fe Community College*  
 Mark DuBois—*Illinois Central College*  
 Genny Espinoza—*Richland College*  
 Carolyn Z. Gillay—*Saddleback College*  
 Sharon Gray—*Augustana College*  
 Tom Gutnick—*Northern Virginia Community College*  
 Jason Hebert—*Pearl River Community College*  
 Sadie Hébert—*Mississippi Gulf Coast College*  
 Lisa Hopkins—*Tulsa Community College*  
 Barbara James—*Richland Community College*  
 Nilofar Kadivi—*Richland Community College*  
 Jean Kent—*Seattle Community College*

Alan Strozer—*Canyons College*  
Lo-An Tabar-Gaul—*Mesa Community College*  
Jonathan S. Weissman—*Finger Lakes Community College*  
Tebring Wrigley—*Community College of Allegheny County*  
Michelle Youngblood-Petty—*Richland College*

A very special thank you also goes to Jean Kent, North Seattle Community College, and Teresa Nickeson, University of Dubuque, for taking time to provide additional feedback and sharing student comments about the book.

Thanks are in order to colleagues at William Rainey Harper College for their support and encouragement, especially Ken Perkins, Enrique D'Amico, and Dave Braunschweig.

Most of all, I would like to thank my family for their patience and encouragement. My wonderful husband, Greg Morris, has been a constant source of love, understanding, support, and encouragement. Thank you, Greg! A big shout-out to my children, James and Karen, who grew up thinking that everyone's Mom had their own website. Thank you both for your understanding, patience, and timely suggestions! And, finally, a very special dedication to the memory of my father who is greatly missed.

## About the Author

Terry Ann Felke-Morris is a Professor Emerita of Computer Information Systems at William Rainey Harper College in Palatine, Illinois. She holds a Doctor of Education degree, a Master of Science degree in information systems, and numerous certifications, including Adobe Certified Dreamweaver 8 Developer, WOW Certified Associate Webmaster, Microsoft Certified Professional, Master CIW Designer, and CIW Certified Instructor.

Dr. Felke-Morris has been honored with Harper College's Glenn A. Reich Memorial Award for Instructional Technology in recognition of her work in designing the college's Web Development program and courses. In 2006, she received the Blackboard Greenhouse Exemplary Online Course Award for use of Internet technology in the academic environment. Dr. Felke-Morris received two international awards in 2008: the Instructional Technology Council's Outstanding e-Learning Faculty Award for Excellence and the MERLOT Award for Exemplary Online Learning Resources—MERLOT Business Classics.

With more than 25 years of information technology experience in business and industry, Dr. Felke-Morris published her first website in 1996 and has been working with the Web ever since. A long-time promoter of Web standards, she was a member of the Web Standards Project Education Task Force. Dr. Felke-Morris is the author of the popular textbook *Basics of Web Design: HTML5 & CSS3*, currently in its fourth edition. She was instrumental in developing the Web Development certificate and degree programs at William Rainey Harper College. For more information about Dr. Terry Ann Felke-Morris, visit <http://terrymorris.net>.

# Introduction to the Internet and World Wide Web

## Chapter Objectives

In this chapter, you will learn how to . . .

- Describe the evolution of the Internet and the Web
- Explain the need for web standards
- Describe universal design
- Identify benefits of accessible web design
- Identify reliable resources of information on the Web
- Identify ethical use of the Web
- Describe the purpose of web browsers and web servers
- Identify networking protocols
- Define URIs and domain names
- Describe HTML, XHTML, and HTML5
- Describe popular trends in the use of the Web

**The Internet and the Web are parts of our daily lives.** How did they begin? What networking protocols and programming languages work behind the scenes to display a web page? This chapter provides an introduction to some of these topics and is a foundation for the information that web developers need to know. You'll be introduced to Hypertext Markup Language (HTML), the language used to create web pages.

# 1.1 The Internet and the Web

## The Internet

The **Internet**, the interconnected network of computer networks that spans the globe, seems to be everywhere today. It has become part of our lives. You can't watch television or listen to the radio without being urged to visit a website. Even newspapers and magazines have a place on the Internet.

## Birth of the Internet

The Internet began as a network to connect computers at research facilities and universities. Messages in this network would travel to their destination by multiple routes, or paths. This configuration allowed the network to function even if parts of it were broken or destroyed. In such an event, the message would be rerouted through a functioning portion of the network while traveling to its destination. This network was developed by the Advanced Research Projects Agency (ARPA)—and the ARPAnet was born. Four computers (located at UCLA, Stanford Research Institute, University of California Santa Barbara, and the University of Utah) were connected by the end of 1969.

## Growth of the Internet

As time went on, other networks, such as the National Science Foundation's NSFnet, were created and connected with the ARPAnet. Use of this interconnected network, or Internet, was originally limited to government, research, and educational purposes. The number of individuals accessing the Internet continues to grow each year. According to Internet World Stats (<http://www.internetworldstats.com/emarketing.htm>), the percentage of the global population that used the Internet was 0.4% in 1995, 5.8% in 2000, 15.7% in 2005, 28.8% in 2010, 45% in 2015, and 49.6% in 2017. Visit <http://www.internetworldstats.com> to explore more statistics about the usage and growth of the Internet.

The lifting of the restriction on commercial use of the Internet in 1991 set the stage for future electronic commerce: Businesses were now welcome on the Internet. However, the Internet was still text based and not easy to use. The next set of developments solved this issue.

## Birth of the Web

While working at CERN, a research facility in Switzerland, **Tim Berners-Lee** envisioned a means of communication for scientists by which they could easily “hyperlink” to another research paper or article and immediately view it. Berners-Lee created the World Wide Web to fulfill this need. In 1991, Berners-Lee posted the code for the Web in a newsgroup and made it freely available. This version of the World Wide Web used **Hypertext Transfer Protocol (HTTP)** to communicate between the client computer and the web server, used **Hypertext Markup Language (HTML)** to format the documents, and was text based.

VideoNote  
Evolution of the Web

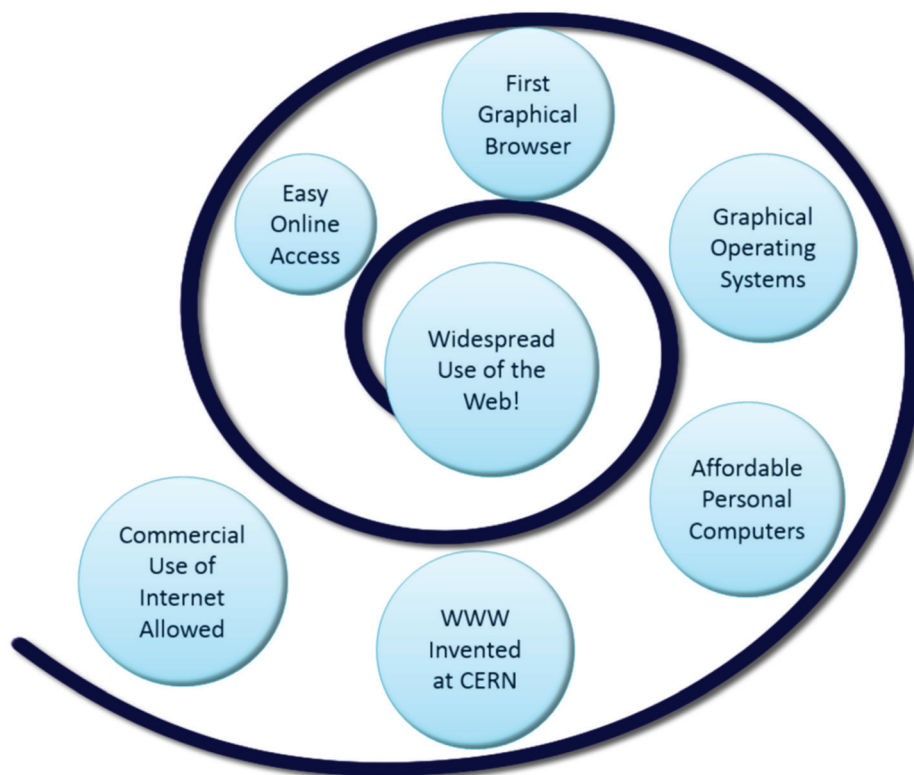

## The First Graphical Browser

In 1993, Mosaic, the first graphical web browser became available. Marc Andreessen and graduate students working at the National Center for Supercomputing Applications (NCSA) at the University of Illinois Urbana-Champaign developed Mosaic. Some individuals in this

group later created another well-known web browser—Netscape Navigator—which is an ancestor of today's Mozilla Firefox browser.

## Convergence of Technologies

By the early 1990s, personal computers with easy-to-use graphical operating systems (such as Microsoft's Windows, IBM's OS/2, and Apple's Macintosh OS) were increasingly available and affordable. Online service providers such as CompuServe, AOL, and Prodigy offered low-cost connections to the Internet. Figure 1.1 depicts this convergence of available computer hardware, easy-to-use operating systems, low-cost Internet connectivity, the HTTP protocol and HTML language, and a graphical browser that made information on the Internet much easier to access. The **World Wide Web**—the graphical user interface to information stored on computers running web servers connected to the Internet—had arrived!

**Figure 1.1** Convergence of Technologies

## Who Runs the Internet?

You may be surprised that there is no single person “in charge” of the global interconnected network of computer networks known as the Internet. Instead, Internet infrastructure standards are overseen by groups such as the **Internet Engineering Task Force (IETF)** and the **Internet Architecture Board (IAB)**. The IETF is the principal body engaged in the development of new Internet protocol standard specifications. It is an open international community of network designers, operators, vendors, and researchers concerned with the evolution of Internet architecture and the smooth operation of the Internet. The actual technical work of the IETF is completed in its working groups. These working groups are organized into areas by topic, such as security and routing.

The IAB is a committee of the IETF and provides guidance and broad direction to the IETF. As a function of this purpose, the IAB is responsible for the publication of the **Request for Comments (RFC)** document series. An RFC is a formal document from the IETF that is drafted by a committee and subsequently reviewed by interested parties. RFCs are available for online review at <http://www.ietf.org/rfc.html>. Some RFCs are informational in nature, while others are meant to become Internet standards. In the latter case, the final version of the RFC becomes a new standard. Future changes to the standard must be made through subsequent RFCs.

The **Internet Corporation for Assigned Numbers and Names (ICANN)**, <http://www.icann.org>, was created in 1998 and is a nonprofit organization. Its main function is to coordinate the assignment of Internet domain names, IP address numbers, protocol parameters, and protocol port numbers. Prior to 1998, the **Internet Assigned Numbers Authority (IANA)** coordinated these functions. IANA still performs certain functions under the guidance of ICANN and maintains a website at <http://www.iana.org>.

## Intranets and Extranets

Recall that the Internet is an interconnected network of computer networks that is globally available. When an organization needs the communication capabilities of the Internet, but doesn't want its information to be available to everyone, either an intranet or extranet is appropriate.

An **intranet** is a private network that is contained within an organization or business. Its purpose is to share organizational information and resources among coworkers. When an intranet connects to the outside Internet, usually a gateway or firewall protects the intranet from unauthorized access.

An **extranet** is a private network that securely shares part of an organization's information or operations with external partners such as suppliers, vendors, and customers. Extranets can be used to exchange data, share information exclusively with business partners, and collaborate with other organizations. Privacy and security are important issues in extranet use. Digital certificates, encryption of messages, and virtual private networks (VPNs) are some technologies used to provide privacy and security for an extranet. Digital certificates and encryption used in e-commerce are discussed in Chapter 12.

## 1.2 Web Standards and Accessibility

Just as with the Internet, no single person or group runs the World Wide Web. However, the **World Wide Web Consortium** (<http://www.w3.org>), referred to as the **W3C**, takes a proactive role in developing recommendations and prototype technologies related to the Web. Topics that the W3C addresses include web architecture, standards for web design, and accessibility. In an effort to standardize web technologies, the W3C produces specifications called recommendations.

### W3C Recommendations

The W3C Recommendations are created in working groups with input from many major corporations involved in building web technologies. These recommendations are not rules; they are guidelines. Major software companies that build web browsers, such as Microsoft, do not always follow the W3C Recommendations. This makes life challenging for web developers because not all browsers will display a web page in exactly the same way. The good news is that there is a convergence toward the W3C Recommendations in new versions of major

browsers. You'll follow W3C Recommendations as you code web pages in this book. Following the W3C Recommendations is the first step toward creating a website that is accessible.

## Web Standards and Accessibility

The **Web Accessibility Initiative (WAI)** (<http://www.w3.org/WAI>), is a major area of work by the W3C. Since the Web has become an integral part of daily life, there is a need for all individuals to be able to access it.

The Web can present barriers to individuals with visual, auditory, physical, and neurological disabilities. An **accessible** website provides accommodations that help individuals overcome these barriers. The WAI has developed recommendations for web content developers, web authoring tool developers, web browser developers, and developers of other user agents to facilitate use of the Web by those with special needs. See the WAI's **Web Content Accessibility Guidelines (WCAG)** at <http://www.w3.org/WAI/WCAG20/glance/WCAG2-at-a-Glance.pdf> for a quick overview.

The WAI continues its work toward an accessible Web. In 2017 the WAI released a draft of WCAG 2.1 which is intended to extend WCAG 2.0 and introduce additional success criteria. The new criteria include requirements for increased support of mobile device accessibility, low vision accessibility, and cognitive and learning disability accessibility.

Focus on  
Accessibility

## Accessibility and the Law

The **Americans with Disabilities Act (ADA)** of 1990 is a federal civil rights law that prohibits discrimination against people with disabilities. The ADA requires that business, federal, and state services are accessible to individuals with disabilities.

**Section 508 of the Federal Rehabilitation Act** was amended in 1998 to require that U.S. government agencies give individuals with disabilities access to information technology that is comparable to the access available to others. This law requires developers creating information technology (including web pages) for use by the federal government to provide for accessibility. The **Federal IT Accessibility Initiative** (<http://www.section508.gov>) provides accessibility requirement resources for information technology developers. As the Web and Internet technologies developed, it became necessary to review the original Section 508 requirements. New Section 508 requirements, commonly referred to as the Section 508 Refresh, were aligned to WCAG 2.0 guidelines and published in 2017. This textbook focuses on WCAG 2.0 guidelines to provide accessibility.

In recent years, state governments have also begun to encourage and promote web accessibility. The Illinois Information Technology Accessibility Act (IITAA) guidelines (see <http://www.dhs.state.il.us/IITAA/IITAAWebImplementationGuidelines.html>) are an example of this trend.

Focus on  
Accessibility

## Universal Design for the Web

**Universal design** is a “strategy for making products, environments, operational systems, and services welcoming and usable to the most diverse range of people possible” (<https://www.dol.gov/odep/topics/UniversalDesign.htm>). Examples of universal design are all around us. The cutouts on curbs that make it possible for people in wheelchairs to access the street also benefit a person pushing a stroller or riding a Segway Personal Transporter (Figure 1.2). Doors that

**Figure 1.2** A smooth ride is a benefit of universal design

open automatically for people with mobility challenges also benefit people carrying packages. A ramp is useful for a person in a wheelchair, a person dragging a rolling backpack or carry-on bag, and so on.

Awareness of universal design by web developers has been steadily increasing. Forward-thinking web developers design with accessibility in mind because it is the right thing to do. Providing access for visitors with visual, auditory, and other challenges should be an integral part of web design rather than an afterthought.

A person with visual difficulties may not be able to use graphical navigation buttons and may use a screen reader device to provide an audible description of the web page. By making a few simple changes, such as providing text descriptions for the images and perhaps providing a text navigation area at the bottom of the page, web developers can make the page accessible. Often, providing for accessibility increases the usability of the website for all visitors.

### Focus on Accessibility

Accessible websites, with alternative text for images, headings used in an organized manner, and captions or transcriptions for multimedia features, are more easily used not only by visitors with disabilities, but also by visitors using a browser on a mobile device such as a phone or tablet. Finally, accessible websites may be more thoroughly indexed by search engines, which can be helpful in bringing new visitors to a site. As this text introduces web development and design techniques, corresponding web accessibility and usability issues are discussed.

## 1.3 Information on the Web

These days anyone can publish just about anything on the Web. In this section we'll explore how you can tell if the information you've found is reliable and how you can use that information.

### Reliability and Information on the Web

There are many websites—but which ones are reliable sources of information? When visiting websites to find information, it is important not to take everything at face value (Figure 1.3).

Questions to ask about web resources are listed as follows:

- **Is the organization credible?**

**Figure 1.3** Who really updated that web page you are viewing?

Anyone can post anything on the Web! Choose your information sources wisely. First, evaluate the credibility of the website itself. Does it have its own domain name, such as <http://mywebsite.com>, or is it a free website consisting of just a folder of files hosted on a free web hosting site (such as [weebly.com](http://weebly.com), [awardspace.com](http://awardspace.com), or [000webhost.com](http://000webhost.com))? The URL of a free website usually includes part of the free web host's domain name. Information obtained from a website that has its own domain name will usually (but not always) be more reliable than information obtained from a free website.

Evaluate the type of domain name: Is it for a nonprofit organization (.org), a business (.com or .biz), or an educational institution (.edu)? Businesses may provide information in a biased manner, so be careful. Nonprofit organizations and schools will sometimes treat a subject more objectively.

- **How recent is the information?**

Another item to look at is the date the web page was created or last updated. Although some information is timeless, very often a web page that has not been updated for several years is outdated and may not be the best source of information.

- **Are there links to additional resources?**

Hyperlinks indicate websites with supporting or additional information that can be helpful to you in your research as you explore a topic. Look for these types of hyperlinks to aid your studies.

- **Is it Wikipedia?**

Wikipedia (<http://wikipedia.org>) is a good place to begin research, but don't accept what you read there for fact, and avoid using Wikipedia as a resource for academic assignments. Why? Well, except for a few protected topics, anyone can update Wikipedia with anything! Usually it all gets sorted out eventually—but be aware that the information you read may not be valid.

Feel free to use Wikipedia to begin exploring a topic, but then scroll down to the bottom of the Wikipedia web page and look for “References”—and then explore those websites and others that you may find. As you gather information on these sites, also consider the other criteria: credibility, domain name, timeliness, and links to additional resources.

## Ethical Use of Information on the Web

This wonderful technology called the World Wide Web provides us with information, graphics, and music—all virtually free (after you pay your Internet service provider, of course). Let's consider the following issues relating to the ethical use of this information:

- Is it acceptable to copy someone's graphic to use on your own website?
- Is it acceptable to copy someone's website design to use on your own site or on a client's site?
- Is it acceptable to copy an essay that appears on a web page and use it, or parts of it, as your own writing?
- Is it acceptable to insult someone on your website or link to that person's site in a derogatory manner?

The answer to all of these questions is no. Using someone's graphic without permission is the same as stealing it. In fact, if you link to it, you are actually using up some of the site's bandwidth and may be costing the owner money. Instead, ask the owner of the website for permission to use the graphic. If permission is granted, store the graphic on your own website and be sure to indicate the source of the graphic when you display it on your web page. The key is to request permission before using someone else's resources. Copying the website design of another person or company is also a form of stealing. Any text or graphic on a website is automatically copyrighted in the United States, regardless of whether a copyright symbol appears on the site or not. Insulting a person or company on your website or linking to the person's or company's website in a derogatory manner could be considered a form of defamation.

Issues like these, related to intellectual property, copyright, and freedom of speech, are regularly discussed and decided in courts of law. Good Web etiquette requires that you ask permission before using others' work, give credit for what you use (“fair use” in the U.S.

**Focus on  
Ethics**

copyright law), and exercise your freedom of speech in a manner that is not harmful to others. The **World Intellectual Property Organization (WIPO)**, <http://wipo.int>, is dedicated to protecting intellectual property rights internationally.

What if you'd like to retain ownership, but make it easy for others to use or adapt your work? **Creative Commons**, <http://creativecommons.org>, is a nonprofit organization that provides free services that allow authors and artists to register a type of a copyright license called a Creative Commons license. There are several licenses to choose from, depending on the rights you wish to grant. The Creative Commons license informs others as to exactly what they can and cannot do with your creative work. See <http://meyerweb.com/eric/tools/color-blend> to view a web page licensed under a Creative Commons Attribution-ShareAlike 1.0 License.

## Checkpoint 1.1

1. Describe the difference between the Internet and the Web.
2. Explain three events that contributed to the commercialization and exponential growth of the Internet.
3. Is the concept of universal design important to web developers? Explain your answer.

## 1.4 Network Overview

A **network** consists of two or more computers connected for the purpose of communicating and sharing resources. Common components of a network are shown in Figure 1.4 and include the following:

- Server computer(s)
- Client workstation computer(s)
- Shared devices such as printers
- Networking devices (routers, hubs, and switches) and the media that connect them

**Figure 1.4**  
Common  
components of  
a network

The **clients** are the computer workstations used by individuals, such as a personal computer (PC) on a desk. The **server** receives requests from client computers for resources such as files. Computers used as servers are usually kept in a protected, secure area and are accessed only by network administrators. Networking devices, such as hubs and switches, provide network connections for computers, and routers direct information from one network to another. The **media** connecting the clients, servers, peripherals, and networking devices may consist of copper cables, fiber optic cables, or wireless technologies.

Networks vary in scale. A **local area network (LAN)** is usually confined to a single building or group of connected buildings. Your school computer lab may use a LAN. If you work in an office, you probably use a computer connected to a LAN. A **wide area network (WAN)** is geographically dispersed and usually uses some form of public or commercial communications network. For example, an organization with offices on both the East and West coasts of the United States probably uses a WAN to provide a link between the LANs at each of the offices.

A **backbone** is a high-capacity communication link that carries data gathered from smaller links that interconnect with it. On the Internet, a backbone is a set of paths that local or regional networks connect to for long-distance interconnection. The Internet is a group of interconnected networks with very high-speed connectivity provided by the Internet backbones.

## 1.5 The Client/Server Model

The term **client/server** dates from the 1980s and refers to personal computers joined by a network. “Client/server” can also describe a relationship between two computer programs—the client and the server. The client requests some type of service (such as a file or database access) from the server. The server fulfills the request and transmits the results to the client over a network. While both the client and the server programs can reside on the same computer, typically they run on different computers (Figure 1.5). It is common for a server to handle requests from multiple clients.

The Internet is a great example of client/server architecture at work. Consider the following scenario: An individual is at a computer using a web browser client to access the Internet. The individual uses the web browser to visit a website, let’s say <http://www.yahoo.com>. The server is the web server program running on the computer with an IP address that corresponds to yahoo.com. It is contacted, locates the web page and related resources that were requested, and responds by sending them to the individual.

**Figure 1.5** Web client and web server

Here's how to distinguish between web clients and web servers:

#### Web Client

- Connected to the Internet when needed
- Usually runs web browser (client) software such as Microsoft Edge or Firefox
- Uses HTTP
- Requests web pages from a server
- Receives web pages and files from a server

#### Web Server

- Continually connected to the Internet
- Runs web server software (such as Apache or Internet Information Server)
- Uses HTTP
- Receives a request for the web page
- Responds to the request and transmits the status code, web page, and associated files

When clients and servers exchange files, they often need to indicate the type of file that is being transferred; this is done through the use of a MIME type. **Multipurpose Internet Mail Extensions (MIME)** are rules that allow multimedia documents to be exchanged among many different computer systems. MIME was initially intended to extend the original Internet e-mail protocol, but it is also used by HTTP. MIME provides for the exchange of seven different media types on the Internet: audio, video, image, application, message, multipart, and text. MIME also uses subtypes to further describe the data. The MIME type of a web page is text/html. MIME types of GIF and JPEG images are image/gif and image/jpeg, respectively.

A web server determines the MIME type of a file before the file is transmitted to the web browser. The MIME type is sent along with the document. The web browser uses the MIME type to determine how to display the document.

How does information get transferred from the web server to the web browser? Clients (such as web browsers) and servers (such as a web server) exchange information through the use of communication protocols such as HTTP, TCP, and IP, which are introduced in the next section.

## 1.6 Internet Protocols

**Protocols** are rules that describe how clients and servers communicate with each other over a network. There is no single protocol that makes the Internet and Web work; a number of protocols with specific functions are needed.

### File Transfer Protocol (FTP)

**File Transfer Protocol (FTP)** is a set of rules that allow files to be exchanged between computers on the Internet. Unlike HTTP, which is used by web browsers to request web pages and their associated files in order to display a web page, FTP is used simply to move files

from one computer to another. Web developers commonly use FTP to transfer web page files from their computers to web servers. FTP is also commonly used to download programs and files from other servers to individual computers.

## E-mail Protocols

Most of us take e-mail for granted, but there are two servers involved in its smooth functioning: an incoming mail server and an outgoing mail server. When you send e-mail to others, **Simple Mail Transfer Protocol (SMTP)** is used. When you receive e-mail, **Post Office Protocol** (POP; currently **POP3**) and **Internet Message Access Protocol (IMAP)** can be used.

## Hypertext Transfer Protocol (HTTP)

HTTP is a set of rules for exchanging files such as text, images, audio, video, and other multimedia on the Web. Web browsers and web servers usually use this protocol. When the user of a web browser requests a file by typing a website address or clicking on a hyperlink, the browser builds an HTTP request and sends it to the server. The web server in the destination machine receives the request, does any necessary processing, and responds with the requested file and any associated files (such as image files, media files, and other related files).

## Transmission Control Protocol/Internet Protocol (TCP/IP)

**Transmission Control Protocol/Internet Protocol (TCP/IP)** has been adopted as the official communication protocol of the Internet. TCP and IP have different functions that work together to ensure reliable communication over the Internet.

### TCP

The purpose of **TCP** is to ensure the integrity of network communication. TCP starts by breaking files and messages into individual units called **packets**. These packets (see Figure 1.6) contain information such as the destination, source, sequence number, and checksum values used to verify the integrity of the data.

**Figure 1.6** TCP packet

TCP is used together with IP to transmit files efficiently over the Internet. IP takes over after TCP creates the packets, using IP addressing to send each packet over the Internet via the best path at the particular time. When the destination address is reached, TCP verifies the integrity of each packet by using the checksum, requests a resend if a packet is damaged, and reassembles the file or message from the multiple packets.

## FAQ What is HTTP/2?

HTTP/2 will be the first major update to HTTP, which was first developed in 1999. As websites have become more image and media intensive, the number of requests needed to display a web page and its related files have increased. A major benefit of HTTP/2 will be quicker loading of web pages by processing multiple concurrent HTTP requests. For more information about HTTP/2, visit <https://http2.github.io>.

# 1.7 Uniform Resource Identifiers and Domain Names

## URIs and URLs

A **Uniform Resource Identifier (URI)** identifies a resource on the Internet. A **Uniform Resource Locator (URL)** is a type of URI which represents the network location of a resource such as a web page, a graphic file, or an MP3 file. The URL consists of the protocol, the domain name, and the hierarchical location of the file on the web server.

The URL `http://www.webdevfoundations.net`, shown in Figure 1.8, denotes the use of HTTP protocol and the web server named `www` at the domain name of `webdevfoundations.net`. In this case, the root file (usually `index.html` or `index.htm`) in the directory named `chapter1` will be displayed.

**Figure 1.8** URL Describing a file within a folder

## Domain Names

A **domain name** locates an organization or other entity on the Internet. The purpose of the Domain Name System (DNS) is to divide the Internet into logical groups and understandable names by identifying the exact address and type of the organization. The DNS associates the text-based domain names with the unique numeric IP address assigned to a device.

Let's consider the domain name `www.google.com`. The portion `"google.com"` is the domain name that is registered to Google. The `".com"` is the top-level domain name. The `"google"` is considered a second-level domain name. The `"www"` is the name of the web sever (sometimes called the **host**) at the `google.com` domain.

A **subdomain** can be configured to house a separate website located at the same domain. For example, Google's Gmail can be accessed by using the subdomain "gmail" in the domain name (gmail.google.com). Google Maps can be accessed at maps.google.com, and Google News Search is available at news.google.com. See <http://www.labnol.org/internet/popular-google-subdomains/5888/> for a list of the top 40 Google subdomains. The combination of a host/subdomain, second-level domain, and top-level domain name (such as www.google.com or mail.google.com) is called a **fully qualified domain name (FQDN)**.

## Top-Level Domain Names

A **top-level domain (TLD)** identifies the rightmost part of the domain name, starting with the final period. A TLD is either a **generic top-level domain (gTLD)**, such as .com for commercial, or a **country-code top-level domain**, such as .fr for France. The **Internet Assigned Numbers Authority (IANA)** website has a complete list of TLDs (<http://www.iana.org/domains/root/db>).

## Generic Top-Level Domain Names (gTLDs)

The Internet Corporation for Assigned Names and Numbers (ICANN) administers gTLDs (<http://www.icann.org>). Table 1.1 shows several common gTLDs and their intended use.

**Table 1.1** Top-level domains

Generic TLD	Used By
.aero	Air-transport industry
.asia	Pan-Asia and Asia Pacific community
.biz	Businesses
.cat	Catalan linguistic and cultural community
.com	Commercial entities
.coop	Cooperative
.edu	Restricted to accredited degree-granting institutions of higher education
.gov	Restricted to government use
.info	Unrestricted use
.int	International organization (rarely used)
.jobs	Human resources management community
.mil	Restricted to military use
.mobi	Corresponds to a .com website—the .mobi site is designed for easy access by mobile devices
.museum	Museums
.name	Individuals
.net	Entities associated with network support of the Internet, usually Internet service providers or telecommunication companies
.org	Nonprofit entities
.post	Universal Postal Union, an agency of the United Nations
.pro	Professionals such as accountants, physicians, and lawyers
.tel	Contact information for individuals and businesses
.travel	Travel industry

The .com, .org, and .net TLD designations are currently used on the honor system, which means that, for example an individual who owns a shoe store (not related to networking) can register shoes.net.

Expect the number and variety of gTLDs to increase. As of 2017 there were over 1,500 TLDs. The new gTLDs include place names (.quebec, .vegas, and .moscow), retail terms (.blackfriday), financial terms (.cash, .trade, and .loans), technology terms (.systems, .technology, and .app), and whimsical, fun terms (.ninja, .buzz, and .cool). ICANN has set a schedule to periodically launch new gTLDs. Visit <http://newgtlds.icann.org/en/program-status/delegated-strings> for a list of the newest gTLDs.

## Country-Code Top-Level Domain Names

Two-character country codes have also been assigned as TLD names. These codes were originally intended to be meaningful by designating the geographical location of the individual or organization that registered the name. Table 1.2 lists some popular country codes used on the Web.

**Table 1.2** Country codes

Country Code TLD	Country
.au	Australia
.de	Germany
.es	Spain
.eu	European Union (a group of countries rather than a single country)
.in	India
.jp	Japan
.ly	Libya
.nl	The Netherlands
.us	United States
.ws	Samoa

The IANA website at <http://www.iana.org/domains/root/db> has a complete list of country-code TLDs. Domain names with country codes are often used for municipalities, schools, and community colleges in the United States. For example, the domain name [www.harper.cc.il.us](http://www.harper.cc.il.us) denotes, from right to left, the United States, Illinois, community college, Harper, and the web server named “www” as the site for Harper College in Illinois.

Although country-code TLD names were intended to designate geographical location, it is fairly easy to obtain a domain name with a country-code TLD that is not local to the registrant. Examples of non-geographical use of country-code TLDs include domain names such as [mediaqueri.es](http://mediaqueri.es), [webteacher.ws](http://webteacher.ws), and [bit.ly](http://bit.ly). Visit <http://register.com>, <http://godaddy.com>, and many other domain name registration companies for examples of readily available country-code TLDs.

## Domain Name System (DNS)

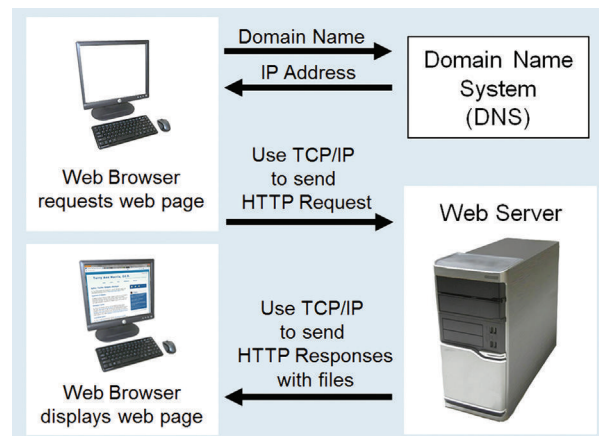

The DNS associates domain names with IP addresses. The following happens each time a new URL is typed into a web browser:

1. The DNS is accessed.
2. The corresponding IP address is obtained and returned to the web browser.

3. The web browser sends an HTTP request to the destination computer with the corresponding IP address.
4. The HTTP request is received by the web server.
5. The necessary files are located and sent by HTTP responses to the web browser.
6. The web browser renders and displays the web page and associated files.

We all get impatient sometimes when we need to view a web page. The next time you wonder why it is taking so long to display a web page, think about all of the processing that goes on behind the scenes before the browser receives the files needed to display the web page (Figure 1.9).

**Figure 1.9**  
Accessing a  
web page

## 1.8 Markup Languages

**Markup languages** consist of sets of directions that tell the browser software (and other user agents such as mobile phones) how to display and manage a web document. These directions are usually called tags and perform functions such as displaying graphics, formatting text, and referencing hyperlinks.

### Standard Generalized Markup Language (SGML)

**SGML** is a standard for specifying a markup language or tag set. SGML in itself is not a document language, but a description of how to specify one and create a document type definition (DTD). When Tim Berners-Lee created HTML, he used SGML to create the specification.

### Hypertext Markup Language (HTML)

HTML is the set of markup symbols or codes placed in a file intended for display on a web browser. The web browser renders the code in the HTML file and displays the web page document and associated files. The W3C (<http://www.w3.org>) sets the standards for HTML.

### Extensible Markup Language (XML)

**XML** was developed by the W3C as a flexible method to create common information formats and share the format and the information on the Web. It is a text-based syntax designed to describe, deliver, and exchange structured information. It is not intended

to replace HTML, but to extend the power of HTML by separating data from presentation. Using XML, developers can create whatever tags they need to describe their information.

## Extensible Hypertext Markup Language (XHTML)

**XHTML** uses the tags and attributes of HTML4 along with the more rigorous syntax of XML. XHTML was used on the Web for over a decade and you'll find many web pages coded with this markup language. At one point the W3C was working on a new version of XHTML, called XHTML 2.0. However, the W3C stopped development of XHTML 2.0 because it was not backward compatible with HTML4. Instead, the W3C decided to move forward with HTML5.

## HTML5—the Newest Version of HTML

**HTML5** is the successor to HTML4 and replaces XHTML. HTML5 incorporates features of both HTML and XHTML, adds new elements, provides new features such as form edits and native video, and is intended to be backward compatible. The W3C approved HTML5 for final Recommendation status in late 2014. The W3C continued its development of HTML and added more new elements, attributes, and features in an update to HTML5 called HTML5.1. HTML5.1 reached final Recommendation status in late 2016 and work has already begun on HTML5.2.

### Checkpoint 1.2

1. Describe the components of the client/server model as applied to the Internet.
2. Identify two protocols used on the Internet to convey information that use the Internet, but do not use the Web.
3. Explain the similarities and differences between a URL and a domain name.

## 1.9 Popular Uses of the Web

### E-Commerce

Continued growth is expected for **e-commerce**, which is the buying and selling of goods and services on the Internet. The research firm eMarketer projects that worldwide retail e-commerce sales will increase from \$23 trillion in 2017 to \$27 trillion in 2020 (<https://www.emarketer.com/Article/Worldwide-Retail-Ecommerce-Sales-Will-Reach-1915-Trillion-This-Year/1014369>). A study by PEW Research Center indicates that about 80% of American adults shop online (<http://www.pewinternet.org/2016/12/19/online-shopping-and-e-commerce>). As mobile web access has become more commonplace, e-commerce will be regularly done not only from desktop computers, but also from portable devices—tablets, netbooks, smartphones, and technology we haven't even imagined yet.

## Mobile Access

Accessing the Web with devices other than the standard desktop, notebook, and netbook computers is a growing trend. The PEW Research Center reported in 2017 that 77% of Americans own a smartphone and about 50% own a tablet (<http://www.pewinternet.org/fact-sheet/mobile>). Web designers must consider how their pages will display and function not only on personal computers, but also on smartphones, tablets, and other mobile devices.

## Blogs

The trend of keeping a web log, or blog, has been driven by individuals as a forum for personal expression. A **blog** is a journal that is available on the Web; it is a frequently updated page with a chronological list of ideas and links. Blog topics range from politics to technical information to personal diaries. Blogs can focus on one subject or range across a diverse group of topics—it's up to the person, called a blogger, who has created the blog and maintains it. Bloggers usually update their blogs daily with easy-to-use software designed to allow people with little or no technical background to update and maintain a blog. Many blogs are hosted at blog communities such as <http://www.wordpress.com>. Others are hosted at individual websites, such as the blog kept by the web designer Eric Meyer at <http://meyerweb.com>. Businesses have noted the value of blogs as communication and customer relationship tools. Companies such as Microsoft (<http://blogs.msdn.com>) and IBM (<https://www.ibm.com/developerworks/mydeveloperworks/blogs>) utilize blogs in this manner.

## Wikis

A **wiki** is a website that can be updated immediately at any time by visitors, using a simple form on a web page. Some wikis are intended for a small group of people, such as the members of an organization. The most powerful wiki is Wikipedia (<http://wikipedia.org>), an online encyclopedia, which can be updated by anyone at any time. Wikis are a form of social software in action—visitors sharing their collective knowledge to create a resource freely used by all. While there have been isolated incidents of practical jokes, and inaccurate information has occasionally been posted at Wikipedia, the given information and linked resources are a good starting point when exploring a topic.

## Social Networking

Blogs and wikis provide web visitors with new methods for interacting with websites and other people—a use referred to as **social computing**, or **social networking**.

A trendy activity these days is participating in a social networking site such as Facebook (<http://www.facebook.com>) or LinkedIn (<http://www.linkedin.com>). Research firm eMarketer predicts that in 2020, 70% of Internet users will regularly access a social network (<https://www.emarketer.com/Article/Nearly-One-Third-of-World-Will-Use-Social-Networks-Regularly-This-Year/1014157>). If it seems to you as if most of your friends are on Facebook, that may be the case: As of 2017, Facebook had over two billion monthly active users (<http://newsroom.fb.com/company-info>). While LinkedIn was created with professional and business networking in mind, businesses have also found it useful to create Facebook sites to promote their products and services.

Twitter (<http://www.twitter.com>) is a social networking site for **microblogging**, or frequently communicating with a brief message (280 characters or less) called a **tweet**. Twitter users (called **twitterers**) tweet to update a network of friends and followers about their daily activities and observations. Twitter is not limited to personal use. The business world has also discovered the marketing reach that Twitter can provide. Visit <https://business.twitter.com/basics> for insights on how to use Twitter to promote your business and communicate with customers.

## Cloud Computing

Document collaboration sites like Google Drive and Microsoft OneDrive, blogs, wikis, and social networking sites are all accessed via the Internet (the “cloud”) and are examples of **cloud computing**. The National Institute of Standards and Technology (NIST) defines cloud computing as the on-demand use of software and other computing resources hosted at a remote data center (including servers, storage, services, and applications) over the Internet. Expect to see more public and private use of cloud computing in the future.

## RSS

**Really Simple Syndication**, or **Rich Site Summary (RSS)** is used to create newsfeeds from blog postings and other websites. The RSS feeds contain a summary of new items posted to the site. The URL to the RSS feed is usually indicated by the letters XML or RSS in white text within an orange rectangle. A **newsreader** is needed to access the information. Some browsers, such as Firefox and Safari, can display RSS feeds. Commercial and shareware newsreader applications are also available. The newsreader polls the feed URL at intervals and displays the new headlines when requested. RSS provides web developers with a method to push new content to interested parties and (hopefully) generate return visits to the site.

## Podcasts

**Podcasts** are audio files on the web that take the format of an audio blog, radio show, or interview. Podcasts are typically delivered by an RSS feed, but can also be made available by providing the link to a recorded MP3 file on a web page. These files can be saved to your computer or to an MP3 player (such as an iPod) for later listening.

## Web 2.0

Flickr (<http://www.flickr.com>) and Pinterest (<http://pinterest.com>) are two social software sites that provide information-sharing opportunities. Flickr, a photo-sharing site, calls itself the “best way to store, search, sort, and share your photos.” Pinterest describes itself as “a place to discover ideas for all your projects and interests, handpicked by people like you.” Pinterest users “pin” photos from websites they have found useful or intriguing on “boards” that are organized by categories. Users can search for pins, follow other users, and follow boards. Pins of interest are displayed. Websites such as Wikipedia, Flickr, Twitter, and Pinterest are examples of what is called **Web 2.0**. Web 2.0 is the next step in the transition of the Web from isolated static websites to a platform that utilizes technology to provide rich interfaces and social networking opportunities. You may also read Tim O’Reilly’s informative Web 2.0 essay at <http://www.oreilly.com/pub/a/web2/archive/what-is-web-20.html> for more information on this developing topic.

The single trend that you can expect to remain the same for the foreseeable future is the trend of constant change. Internet and web-related technologies are in a constant state of development and improvement. If constant change and the opportunity to learn something new excite you, web development is a fascinating field. The skills and knowledge you gain in this book should provide a solid foundation for your future learning.

### **FAQ** What is the next big thing on the Web?

The Web is changing by the minute. Check the textbook's companion website at <http://www.webdevfoundations.net> for a blog that will help you stay current about web trends.

# Chapter Summary

This chapter has provided a brief overview of Internet, Web, and introductory networking concepts. Much of this information may already be familiar to you.

Visit the textbook's website at <http://www.webdevfoundations.net> for links to the URLs listed in this chapter and to view updated information.

## Key Terms

Accessible	Internet Corporation for Assigned Numbers and Names (ICANN)	Simple Mail Transfer Protocol (SMTP)
Americans with Disabilities Act (ADA)	Internet Engineering Task Force (IETF)	social computing
backbone	Internet Message Access Protocol (IMAP)	social networking
blog	intranet	Standard Generalized Markup Language (SGML)
client/server	IP	subdomain
clients	IP address	tablet
cloud computing	IP Version 4 (IPv4)	TCP
country-code top-level domain	IP Version 6 (IPv6)	Tim Berners-Lee
Creative Commons	local area network (LAN)	top-level domain (TLD)
domain name	markup languages	Transmission Control Protocol/Internet Protocol (TCP/IP)
Domain Name System (DNS)	media	tweet
e-commerce	microblogging	Uniform Resource Indicator (URI)
extranet	Multipurpose Internet Mail Extensions (MIME)	Uniform Resource Locator (URL)
Federal IT Accessibility Initiative	network	universal design
File Transfer Protocol (FTP)	newsreader	Web 2.0
fully qualified domain name (FQDN)	packets	Web Accessibility Initiative (WAI)
generic top-level domain (gTLD)	podcasts	Web Content Accessibility Guidelines (WCAG)
hashtag	Post Office Protocol (POP3)	web host server
host	protocols	wide area network (WAN)
HTML5	Really Simple Syndication or Rich Site Summary (RSS)	wiki
Hypertext Markup Language (HTML)	Request for Comments (RFC)	World Intellectual Property Organization (WIPO)
Hypertext Transfer Protocol (HTTP)	Section 508 of the Federal Rehabilitation Act	World Wide Web
Internet	server	World Wide Web Consortium (W3C)
Internet Architecture Board (IAB)		XHTML
Internet Assigned Numbers Authority (IANA)		XML

## Review Questions

### Multiple Choice

1. What is a unique text-based Internet address corresponding to a computer's unique numeric IP address called?
  - a. IP address
  - b. domain name
  - c. URL
  - d. user name
2. Select the item below that indicates the top-level domain name for the URL <http://www.mozilla.com>.
  - a. mozilla
  - b. com
  - c. http
  - d. www

3. Of the following organizations, which one coordinates applications for new TLDs?
  - a. Internet Assigned Numbers Authority (IANA)
  - b. Internet Engineering Task Force (IETF)
  - c. Internet Corporation for Assigned Numbers and Names (ICANN)
  - d. World Wide Web Consortium (W3C)
4. Which of the following is a network that covers a small area, such as a group of buildings or campus?
  - a. LAN
  - b. WAN
  - c. Internet
  - d. WWW
5. Which of the following organizations takes a proactive role in developing recommendations and prototype technologies related to the Web?
  - a. World Wide Web Consortium (W3C)
  - b. Web Professional Standards Organization (WPO)
  - c. Internet Engineering Task Force (IETF)
  - d. Internet Corporation for Assigned Numbers and Names (ICANN)
8. \_\_\_\_\_ The World Wide Web was developed to allow companies to conduct e-commerce over the Internet.
9. \_\_\_\_\_ A domain name that ends in .net indicates that the website must be for a networking company.
10. \_\_\_\_\_ An accessible website provides accommodations that help individuals overcome barriers such as visual, auditory, physical, and neurological disabilities.

### Fill in the Blank

11. \_\_\_\_\_ is the set of markup symbols or codes placed in a file intended for display on a web browser.
12. A \_\_\_\_\_ can be configured to house a separate website located at the same domain.
13. A standard language used for specifying a markup language or tag set is \_\_\_\_\_.
14. Frequently communicating by posting brief messages at a social networking site is called \_\_\_\_\_.
15. The purpose of \_\_\_\_\_ is to ensure the integrity of network communication.

### True or False

6. \_\_\_\_\_ A URL is one type of URI.
7. \_\_\_\_\_ Markup languages contain sets of directions that tell the browser software how to display and manage a web document.

## Hands-On Exercise

1. Twitter (<http://www.twitter.com>) is a social networking website for microblogging, or frequently communicating with a brief message (280 characters or less) called a tweet. Twitter users (referred to as twitterers) tweet to update a network of friends and followers about their daily activities, observations, and information related to topics of interest. A **hashtag** (the #symbol) can be placed in front of a word or term within a tweet to categorize the topic, such as typing the hashtag #SXSWi in all tweets about the SXSW Interactive Conference for the web design industry. The use of a hashtag makes it easy to search for tweets about a category or event in Twitter.

If you don't already use Twitter, sign up for free account at <http://www.twitter.com>. Use your Twitter account to share information about websites that you find useful or interesting. Post at least three tweets. You might tweet about websites that contain useful web design resources. You might describe sites that have interesting features, such

as compelling graphics or easy-to-use navigation. After you begin to develop your own websites, you could tweet about them, too!

Your instructor may direct you to include a distinctive hashtag (for example, something like #CIS110) in your tweets that are related to your web design studies. Searching Twitter for the specified hashtag will make it easy to collect all the tweets posted by the students in your class.

2. Create a blog to document your learning experiences as you study web development. Visit one of the many sites that offer free blogs, such as <http://www.blogger.com>, <http://www.wordpress.com>, or <http://www.tumblr.com>. Follow the site's instructions to establish your own blog. Your blog could be a place to note websites that you find useful or interesting. You might report on sites that contain useful web design resources. You might describe sites that have interesting features, such as compelling graphics or easy-to-use navigation. Write a few sentences about each site that you find intriguing. After you begin to develop your own sites, you could include the URLs and reasons for your design decisions. Share this blog with your fellow students and friends. Display your page in a browser, and print the page. Hand in the printout to your instructor.

## Web Research

1. The World Wide Web Consortium creates standards for the Web. Visit its site at <http://www.w3c.org> and then answer the following questions:
  - a. How did the W3C get started?
  - b. Who can join the W3C? What does it cost to join?
  - c. The W3C home page lists a number of technologies. Choose one that interests you, click on its link, and read the associated pages. List three facts or issues you discover.
2. The Internet Society takes an active leadership role in issues related to the Internet. Visit its site at <http://www.isoc.org> and then answer the following questions:
  - a. Why was the Internet Society created?
  - b. Determine which local chapter is closest to you. Visit its website. List the website's URL and an activity or service that the chapter provides.
  - c. How can you join the Internet Society? What does it cost to join? Would you recommend that a beginning Web developer join the Internet Society? Why or why not?
3. HTTP/2 is the first major update to HTTP, which was first developed in the late 1990s. As websites have become more image and media intensive, the number of requests needed to display a web page and its related files have increased. A major benefit of HTTP/2 will be quicker loading of web pages.

HTTP/2 Resources:

- <http://readwrite.com/2015/02/18/http-update-http2-what-you-need-to-know>
- <https://http2.github.io>
- <http://www.engadget.com/2015/02/24/what-you-need-to-know-about-http-2>
- <https://tools.ietf.org/html/rfc7540>

Use the resources listed above as a starting point as you research HTTP/2 and answer the following questions.

- a. Who developed HTTP/2?
- b. When was the HTTP/2 proposed standard published?
- c. Describe three methods used by HTTP/2 intended to decrease latency and provide for quicker loading of web pages in browsers.

## Focus on Web Design

1. Visit a website that interests you. Print the home page or one other pertinent page from the site. Write a one-page summary of the site that addresses the following topics:
  - a. What is the URL of the site?
  - b. What is the purpose of the site?
  - c. Who is the intended audience?
  - d. Do you think that the site reaches its intended audience? Why or why not?
  - e. Is the site useful to you? Why or why not?
  - f. Does this site appeal to you? Why or why not? Consider the use of color, images, multimedia, organization, and ease of navigation.
  - g. Would you encourage others to visit this site? Why or why not?
  - h. How could this site be improved?

# HTML Basics

## Chapter Objectives

In this chapter, you will learn how to . . .

- Describe HTML, XHTML, and HTML5
- Identify the markup language in a web page document
- Use the html, head, body, title, and meta elements to code a template for a web page
- Configure the body of a web page with headings, paragraphs, line breaks, divs, lists, and blockquotes
- Configure text with phrase elements
- Configure special characters
- Use the new HTML5 header, nav, main, and footer elements
- Use the anchor element to link from page to page
- Create absolute, relative, and e-mail hyperlinks
- Code, save, and display a web page document
- Test a web page document for valid syntax

**This chapter gets you started on your very first web page.** You'll be introduced to Hypertext Markup Language (HTML), the language used to create web pages. The chapter begins with an introduction to the syntax of HTML5; continues with sample web pages; and introduces HTML structural, phrase, and hyperlink elements as more example web pages are created. You will learn more if you work along with the sample pages in the text. Coding HTML is a skill, and every skill improves with practice.

## 2.1 HTML Overview

**Markup languages** consist of sets of directions that tell the browser software (and other user agents such as mobile phones) how to display and manage a web document. These directions are usually called tags and perform functions such as displaying graphics, formatting text, and referencing hyperlinks.

The World Wide Web is composed of files containing **Hypertext Markup Language (HTML)** and other markup languages that describe web pages. Tim Berners-Lee developed HTML using Standard Generalized Markup Language (SGML). SGML prescribes a standard format for embedding descriptive markup within a document and for describing the structure of a document. SGML is not in itself a document language, but rather a description of how to specify one and create a document type definition (DTD). The W3C (<http://www.w3c.org>) sets the standards for HTML and its related languages. Like the Web itself, HTML is in a constant state of change.

### HTML

HTML is the set of markup symbols or codes placed in a file that is intended for display on a web page. These markup symbols and codes identify structural elements such as paragraphs, headings, and lists. HTML can also be used to place media (such as graphics, video, and audio) on a web page and describe fill-in forms. The browser interprets the markup code and renders the page. HTML permits the platform-independent display of information across a network. No matter what type of computer a web page was created on, any browser running on any operating system can display the page.

Each individual markup code is referred to as an **element** or **tag**. Each tag has a purpose. Tags are enclosed in angle brackets, the < and > symbols. Most tags come in pairs: an opening tag and a closing tag. These tags act as containers and are sometimes referred to as container tags. For example, the text that is between the <title> and </title> tags on a web page would display in the title bar on the browser window. Some tags are used alone and are not part of a pair. For example, a <br> tag that configures a line break on a web page is a stand-alone, or self-contained, tag and does not have a closing tag. Most tags can be modified with **attributes** that further describe their purpose.

### XML

**XML (eXtensible Markup Language)** was developed by the W3C to create common information formats and share the format and the information on the Web. It is a text-based syntax designed to describe, deliver, and exchange structured information, such as RSS feeds. XML is not intended to replace HTML, but to extend the power of HTML by separating data from presentation. Using XML, developers can create any tags they need to describe their information.

### XHTML

**eXtensible HyperText Markup Language (XHTML)** uses the tags and attributes of HTML4 along with the syntax of XML. XHTML was used on the Web for over a decade and you'll find many web pages coded with this markup language. At one point the W3C was working on a new version of XHTML, called XHTML 2.0. However, the W3C stopped development of XHTML 2.0 because it was not backward compatible with HTML4. Instead, the W3C decided to move forward with HTML5.

## HTML5

**HTML5** is the successor to HTML4 and replaces XHTML. HTML5 incorporates features of both HTML and XHTML, adds new elements of its own, provides new features such as form edits and native video, and is intended to be backward compatible.

The W3C approved HTML5 for final Recommendation status in late 2014. The W3C continued its development of HTML and added more new elements, attributes, and features in an update to HTML5 called HTML 5.1. In 2017, HTML5.1 reached final Recommendation status and work had already begun on HTML5.2.

Recent versions of popular browsers, such as Microsoft Edge, Firefox, Safari, Google Chrome, and Opera, support most features of HTML5 and HTML5.1. You'll learn to use HTML5.1 syntax as you work through this textbook. W3C HTML5 documentation is available at <https://www.w3.org/TR/html/>.

### FAQ What software do I need?

No special software is needed to create a web page document; all you need is a text editor. The Notepad text editor is included with Microsoft Windows. TextEdit is distributed with the Mac OS X operating system. (See <http://support.apple.com/kb/TA20406> for configuration information.) An alternative to the operating system's basic text editor is one of the many free or shareware editors that are available, such as Notepad++ for Windows (<http://notepad-plus-plus.org/download>) and BBEdit for Macs (<http://www.barebones.com/products/bbedit/index.html>). Another commonly used alternative is a commercial web-authoring tool, such as Adobe Dreamweaver. Regardless of the software or program you use, having a solid foundation in HTML will be useful.

You will need to test your web pages in the most popular browsers, such as Microsoft Edge, Mozilla Firefox, Apple Safari, and Google Chrome. Access a free download of Firefox at [www.mozilla.org/mozilla/firefox](http://www.mozilla.org/mozilla/firefox). A free download of Google Chrome is available at <http://www.google.com/chrome>.

You will also find the Web Developer Extension for Firefox (<https://addons.mozilla.org/en-us/firefox/addon/web-developer>) to be useful.

## 2.2 Document Type Definition

Because multiple versions and types of HTML and XHTML exist, the W3C recommends identifying the type of markup language used in a web page document with a **Document Type Definition (DTD)**. The DTD identifies the version of HTML contained in your document. Browsers and HTML code validators can use the information in the DTD when processing the web page. The DTD statement, commonly called a **doctype** statement, is the first line of a web page document. The DTD for HTML5 is:

```
<!DOCTYPE html>
```

**Figure 2.1** It's what is under the hood that matters.

## 2.3 Web Page Template

You already know that the HTML markup language tells browsers how to display information on a web page. Let's take a closer look at what's "under the hood" (Figure 2.1) of every web page you create. Every single web page you create will include the DTD and the `html`, `head`, `title`, `meta`, and `body` elements. We will follow the coding style to use lowercase letters and place quotes around attribute values. A basic HTML5 web page template (see `chapter2/template.html` in the student files) is as follows:

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Page Title Goes Here</title>
<meta charset="utf-8">
</head>
<body>
... body text and more HTML tags go here ...
</body>
</html>
```

With the exception of the specific page title, the first seven lines will usually be the same on every web page that you create. Review the code above and notice that the document type definition statement has its own formatting and that the HTML tags all use lowercase letters. Next, let's explore the purpose of the `html`, `head`, `title`, `meta`, and `body` elements.

## 2.4 HTML Element

The purpose of the `html` element is to indicate that the document is HTML formatted. The `html` element tells the browser how to interpret the document. The opening `<html>` tag is placed on a line below the DTD. The closing `</html>` tag indicates the end of the web page and is placed after all other HTML elements in the document.

The `html` element also needs to indicate the spoken language, such as English, of the text in the document. This additional information is added to the `<html>` tag in the form of an attribute, which modifies or further describes the function of an element. The **lang attribute** specifies the spoken language of the document. For example, `lang="en"` indicates the English language. Search engines and screen readers may access this attribute.

## 2.5 Head, Title, Meta, and Body Elements

There are two sections on a web page: the head and the body. The **head section** contains information that describes the web page document. The **body section** contains the actual tags, text, images, and other objects that are displayed by the browser as a web page.

## The Head Section

Elements that are located in the head section include the title of the web page, meta tags that describe the document (such as the character encoding used and information that may be accessed by search engines), and references to scripts and styles. Many of these features do not show directly on the web page.

The **head element** contains the head section, which begins with the `<head>` tag and ends with the `</head>` tag. You will always code at least two other elements in the head section: a title element and a meta element.

The first element in the head section, the **title element**, configures the text that will appear in the title bar of the browser window. The text between the `<title>` and `</title>` tags is called the title of the web page and is accessed when web pages are bookmarked and printed. Popular search engines, such as Google, use the title text to help determine keyword relevance and even display the title text on the results page of a search. A descriptive title that includes the website or organization name is a crucial component for establishing a brand or presence on the Web.

The **meta element** describes a characteristic of a web page, such as the character encoding. **Character encoding** is the internal representation of letters, numbers, and symbols in a file such as a web page or other file that is stored on a computer and may be transmitted over the Internet. There are many different character-encoding sets. However, it is common practice to use a character-encoding set that is widely supported, such as utf-8, which is a form of Unicode (<http://www.unicode.org>). The meta tag is not used as a pair of opening and closing tags. It is considered to be a stand-alone, or **self-contained**, tag (referred to as a **void element** in HTML5). The meta tag uses the **charset attribute** to indicate the character encoding. An example meta tag is as follows:

```
<meta charset="utf-8">
```

## The Body Section

The body section contains text and elements that display directly on the web page in the browser window, also referred to as the browser viewport. The purpose of the body section is to configure the contents of the web page.

The **body element** contains the body section, which begins with the `<body>` tag and ends with the `</body>` tag. You will spend most of your time writing code in the body of a web page. Text and elements typed between the opening and closing body tags will display on the web page in the browser viewport.

## 2.6 Your First Web Page

### Hands-On Practice 2.1

Now that you're familiar with basic elements used on every web page, it's your turn to create your first web page, shown in Figure 2.2.

**Figure 2.2** Your first webpage

**VideoNote**  
Your First  
Web Page

## Create a Folder

You'll find it helpful to create folders to organize your files as you develop the web pages in this book and create your own websites. Use your operating system to create a new folder named mychapter2 on your hard drive or a portable flash drive.

To create a new folder on a Mac:

1. Launch Finder, and select the location where you would like to create the new folder.
2. Choose File > New Folder to create an untitled folder.
3. To rename the folder, select the folder and click on the current name. Type a name for the folder, and press the Return key.

To create a new folder with Windows:

1. Launch File Explorer (formerly called Windows Explorer):
  - a. Display the Desktop.
  - b. Right-click on the Start button and select File Explorer.
2. Navigate to the location where you would like to create the new folder, such as Documents, your C: drive, or an external USB drive.
3. Select the Home tab. Select New Folder.
4. To rename the New Folder, right-click on it, select Rename from the context-sensitive menu, type in the new name, and press the Enter key.

### FAQ Why should I create a folder? Why not just use the desktop?

Folders will help you to organize your work. If you just use the desktop, it would quickly become cluttered and disorganized. It's also important to know that web-sites are organized on web servers within folders. By starting to use folders right away to organize related web pages, you are on your way to becoming a successful web designer.

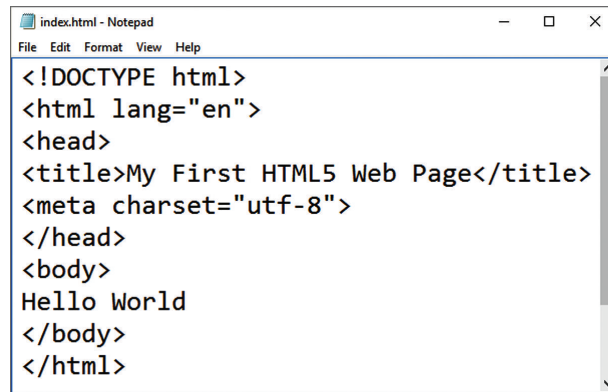

## Your First Web Page

Now you are ready to create your first HTML5 web page. Launch Notepad or another text editor. Type in the following code:

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>My First HTML5 Web Page</title>
<meta charset="utf-8">
</head>
<body>
Hello World
</body>
</html>
```

Notice that the first line in the file contains the doctype. The HTML code begins with an opening `<html>` tag and ends with a closing `</html>` tag. The purpose of these tags is to indicate that the content between them makes up a web page. The head section is delimited by `<head>` and `</head>` tags and contains a pair of title tags with the words “My First HTML5 Web Page” in between, along with a `<meta>` tag to indicate the character encoding.

The body section is delimited by `<body>` and `</body>` tags. The words “Hello World” are typed on a line between the body tags. See Figure 2.3 for a screenshot of the code as it would appear in Notepad. You have just created the source code for a web page document.

```
index.html - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html lang="en">
<head>
<title>My First HTML5 Web Page</title>
<meta charset="utf-8">
</head>
<body>
Hello World
</body>
</html>
```

**Figure 2.3** Code displayed in Notepad. Courtesy of Microsoft Corporation.

## FAQ Do I have to start each tag on its own line?

No, you are not required to start each tag on a separate line. A browser can display a page even if all the tags follow each other on one line with no spaces. Humans, however, find it easier to write and read web page code if line breaks and indentation are used.

## Save Your File

You will save your file with the name of `index.html`. A common file name for the home page of a website is `index.html` or `index.htm`. Web pages use either a `.htm` or a `.html` file extension. The web pages in this book use the `.html` file extension. Display your file in Notepad or another text editor. Select `File` from the menu bar, and then select `Save As`. The `Save As` dialog box will appear. Navigate to your `mychapter2` folder. Using Figure 2.4 as an example, type the file name. Click the `Save` button after you type the file name. Sample solutions for the exercises are available in the student files. If you like, you can compare your work with the solution in the student files at `chapter2/index.html` before you test your page.

**Figure 2.4** The `Save As` dialog box. Courtesy of Microsoft Corporation.

### FAQ Why does my file have a .txt file extension?

In some older versions of Windows, Notepad will automatically append a .txt file extension. If this happens, type the name of the file within quotation marks ("index.html"), and save your file again.

## Test Your Page

There are two ways to test your page:

1. Launch File Explorer or Finder (Mac). Navigate to your index.html file. Double-click index.html. The default browser will launch and will display your index.html page.
2. Launch a web browser. Select File > Open, and navigate to your index.html file. Double-click index.html and click OK. The browser will display your index.html page.

Examine your page. If you are using Microsoft Edge, your page should look similar to the one shown in Figure 2.5. A display of the page using Firefox is shown in Figure 2.2. Look carefully at the browser window. Notice how the browser title bar or browser tab displays the title text, "My First HTML5 Web Page." Some search engines use the text enclosed within the `<title>` and `</title>` tags to help determine the relevancy of keyword searches, so make certain that your pages contain descriptive titles. The title element is also used when viewers bookmark your page or add it to their Favorites. An engaging and descriptive page title may entice a visitor to revisit your page. If your web page is for a company or an organization, it's a best practice to include the name of the company or organization in the title.

**Figure 2.5** Web page displayed by Microsoft Edge. Courtesy of Microsoft Corporation.

### FAQ When I viewed my page in a browser, the file name was index.html.html—why did this happen?

This usually happens when your operating system is configured to hide file extension names. You will correct the file name, using one of the following two methods:

- Use the operating system to rename the file from “index.html.html” to “index.html”.

OR

- Open the index.html.html file in your text editor and save it with the name “index.html”.

It’s a good idea to change the settings in your operating system to show file extension names. Access the system help for your operating system or the resources below for information about how to configure your operating system to show file extension names:

- *Windows*: <http://www.file-extensions.org/article/show-and-hide-file-extensions-in-windows-10>
- *Mac*: [http://www.fileinfo.com/help/mac\\_show\\_extensions](http://www.fileinfo.com/help/mac_show_extensions)

### Checkpoint 2.1

1. Describe the origin, purpose, and features of HTML.
2. Describe the software needed to create and test web pages.
3. Describe the purpose of the head and body sections of a web page.

## 2.7 Heading Element

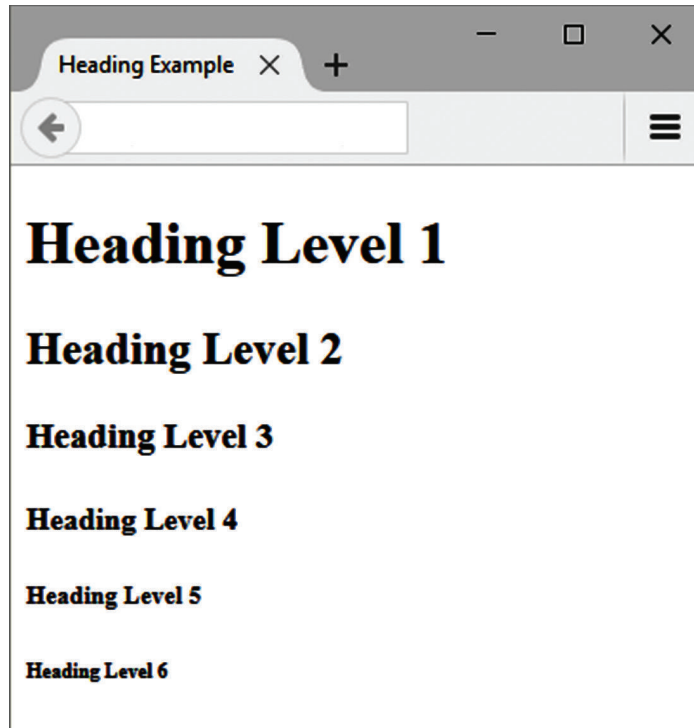

**Heading elements** are organized into six levels: h1 through h6. The text contained within a heading element is rendered as a “block” of text by the browser (referred to as **block display**) and displays with empty space (sometimes called “white space”) above and below. The size of the text is largest for **<h1>** (called the heading 1 tag) and smallest for **<h6>** (called the heading 6 tag). Depending on the font being used (more on font sizes in Chapter 3), the text contained within **<h4>**, **<h5>**, and **<h6>** tags may be displayed smaller than the default text size. All text contained within heading tags is displayed with bold font weight. Figure 2.6 shows a web page document with six levels of headings.

### FAQ Why doesn’t the heading tag go in the head section?

It’s common for students to try to code the heading tags in the head section of the document, but doing this is not valid and will cause issues with the way the browser displays the web page. Even though “heading tag” and “head section” sound similar, always code heading tags in the body section of the web page document.

**Figure 2.6** Sample headings

## Hands-On Practice 2.2

To create the web page shown in Figure 2.6, launch Notepad or another text editor. Select File > Open to edit the HTML5 template file located at chapter2/template.html in the student files. Modify the title element and add heading tags to the body section as indicated by the following highlighted code:

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Heading Example</title>
<meta charset="utf-8">
</head>
<body>
<h1>Heading Level 1</h1>
<h2>Heading Level 2</h2>
<h3>Heading Level 3</h3>
<h4>Heading Level 4</h4>
<h5>Heading Level 5</h5>
<h6>Heading Level 6</h6>
</body>
</html>
```

Save the document as heading.html on your hard drive or flash drive. Launch a browser such as Microsoft Edge or Firefox to test your page. It should look similar to the page shown in Figure 2.6. You can compare your work with the solution found in the student files (chapter2/heading.html).

## Accessibility and Headings

Heading tags can help to make your pages more accessible and usable. It is good coding practice to use heading tags to outline the structure of your web page content. To indicate areas within a page hierarchically, code heading tags numerically as appropriate (h1, h2, h3, and so on), and include page content in block display elements such as paragraphs and lists. In Figure 2.7, the `<h1>` tag contains the name of the website in the logo header area at the top of the web page, the `<h2>` tag contains the topic or name of the page in the content area, and other heading elements are coded in the content area as needed to identify major topics and subtopics.

Focus on  
Accessibility

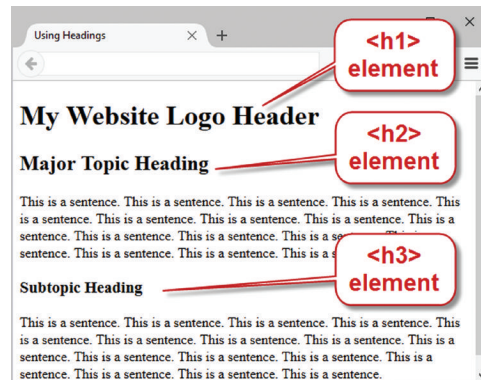

Figure 2.7 Heading tags outline the page

Visually challenged visitors who are using a screen reader can direct the software to display a list of the headings used on a page to focus on the topics that interest them. Your well-organized page will be more usable for every visitor to your site, including those who are visually challenged.

## 2.8 Paragraph Element

**Paragraph elements** are used to group sentences and sections of text together. Text that is contained by `<p>` and `</p>` tags display as a “block” (referred to as block display) and will appear with empty space above and below it. Figure 2.8 shows a web page document with a paragraph after the first heading.

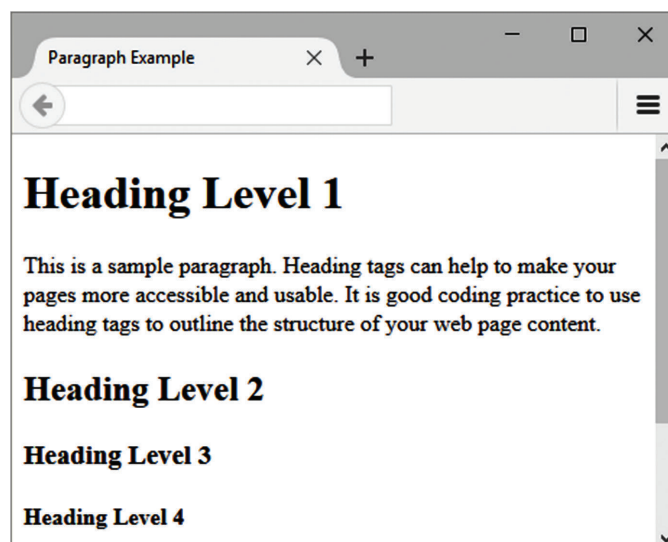

Figure 2.8 Web page using headings and a paragraph

## Hands-On Practice 2.3

To create the web page shown in Figure 2.8, launch a text editor. Select File > Open to edit the file located at chapter2/heading.html in the student files. Modify the page title, and add a paragraph of text to your page below the line with the `<h1>` tags and above the line with the `<h2>` tags. Use the following code as an example:

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Paragraph Example</title>
<meta charset="utf-8">
</head>
<body>
<h1>Heading Level 1</h1>
<p>This is a sample paragraph. Heading tags can help to make your
pages more accessible and usable. It is good coding practice to use
heading tags to outline the structure of your web page content.
</p>
<h2>Heading Level 2</h2>
<h3>Heading Level 3</h3>
<h4>Heading Level 4</h4>
<h5>Heading Level 5</h5>
<h6>Heading Level 6</h6>
</body>
</html>
```

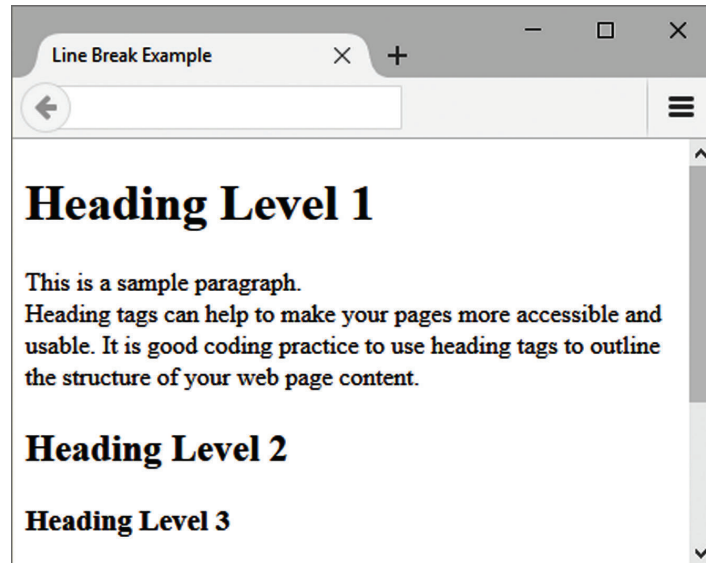

Save the document as paragraph.html on your hard drive or flash drive. Launch a browser to test your page. It should look similar to the page shown in Figure 2.8. You can compare your work with the solution (chapter2/paragraph.html) found in the student files. Notice how the text in the paragraph wraps automatically as you resize your browser window.

## Alignment

As you tested your web pages, you may have noticed that the headings and text begin near the left margin. This placement is called **left alignment** and is the default alignment for web pages. There are times, however, when you want a paragraph or heading to be centered or right aligned. The align attribute can be used for this purpose. The purpose of an attribute is to modify the properties of an HTML element. In this case, the **align attribute** modifies the element's horizontal alignment (left, center, or right) on a web page. To center an element on a web page, use the attribute `align="center"`. To right-align the text within an element, use the `align="right"` attribute. In XHTML syntax, the align attribute can be used with a number of block display elements, including the paragraph (`<p>`) and heading (`<h1>` through `<h6>`) tags. The align attribute is **obsolete** in HTML5, which means that while it may be used in XHTML, the attribute has been removed from the W3C HTML5 specification and is invalid. In Chapter 6, you will learn how to configure alignment using a more modern approach with Cascading Style Sheets (CSS).

## 2.9 Line Break Element

The **line break element** causes the browser to advance to the next line before displaying the next element or portion of text on a web page. The line break tag is not coded as a pair of opening and closing tags. It is a stand-alone, or void element, and is coded as `<br>`. Figure 2.9 shows a web page document with a line break after the first sentence in the paragraph.

**Figure 2.9**  
Notice the line  
break after the  
first sentence

### Hands-On Practice 2.4

To create the web page shown in Figure 2.9, launch a text editor. Select File > Open to edit the file located at chapter2/paragraph.html in the student files. Modify the text contained between the title tags to be “Line Break Example”. Place your cursor after the first sentence in the paragraph (after “This is a sample paragraph.”). Press the Enter key. Save your file. Test your page in a browser, and notice that even though your source code showed the “This is a sample paragraph.” sentence on its own line, the browser did not render it that way. A line break tag is needed to configure the browser to display the second sentence on a new line. Edit the file in a text editor, and add a `<br>` tag after the first sentence in the paragraph, as shown in the following code snippet:

```
<body>
<h1>Heading Level 1</h1>
<p>This is a sample paragraph. <br> Heading tags can help to make your
pages more accessible and usable. It is good coding practice to use
heading tags to outline the structure of your web page content.
</p>
<h2>Heading Level 2</h2>
<h3>Heading Level 3</h3>
<h4>Heading Level 4</h4>
<h5>Heading Level 5</h5>
<h6>Heading Level 6</h6>
</body>
```

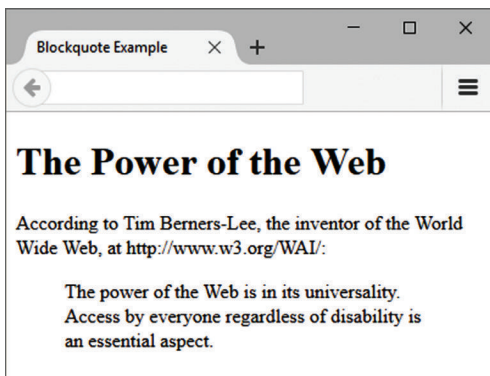

Save your file as linebreak.html. Launch a browser to test your page. It should look similar to the page shown in Figure 2.9. You can compare your work with the solution found in the student files (chapter2/linebreak.html).

## FAQ Why does my web page still look the same?

Often, students make changes to a web page document, but get frustrated because their browser shows an older version of the page. The following troubleshooting tips are helpful when you know you modified your web page, but the changes do not show up in the browser:

1. Make sure you save your page after you make the changes.
2. Verify the location that you are saving your page to—a specific folder on the hard drive or removable storage.
3. Verify the location that your browser is requesting the page from—a specific folder on the hard drive or removable storage.
4. Be sure to click the Refresh or Reload button in your browser.

**Figure 2.10** The text within the blockquote element is indented

## 2.10 Blockquote Element

In addition to organizing text in paragraphs and headings, sometimes you need to add a quotation to a web page. The **blockquote** element is used to display a block of quoted text in a special way—indented from both the left and right margins. A block of indented text begins with a `<blockquote>` tag and ends with a `</blockquote>` tag. Figure 2.10 shows a web page document with a heading, a paragraph, and a blockquote.

## Hands-On Practice 2.5

To create the web page shown in Figure 2.10, launch a text editor. Select File > Open to edit the template file located at `chapter2/template.html` in the student files. Modify the title element. Add a heading tag, a paragraph tag, and a blockquote tag to the body section as indicated by the following highlighted code:

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Blockquote Example</title>
<meta charset="utf-8">
</head>
<body>
<h1>The Power of the Web</h1>
<p>According to Tim Berners-Lee, the inventor of the World Wide Web,
at http://www.w3.org/WAI/;</p>
<blockquote>
The power of the Web is in its universality. Access by everyone
regardless of disability is an essential aspect.
</blockquote>
</body>
</html>
```

Save the document as `blockquote.html` on your hard drive or flash drive. Launch a browser to test your page. It should look similar to the page shown in Figure 2.10. You can compare your work with the solution (`chapter2/blockquote.html`) found in the student files.

You have probably noticed how convenient the `<blockquote>` tag could be if you need to indent an area of text on a web page. You may have wondered whether it would be okay to use the `blockquote` element anytime you would like to indent text or whether the `blockquote` element is reserved only for long quotations. The semantically correct use of the `blockquote` element is only for displaying large blocks of quoted text within a web page. Why should you be concerned about semantics? Consider the future of the Semantic Web, described in *Scientific American* (<http://www.scientificamerican.com/article.cfm?id=the-semantic-web>) as “A new form of Web content that is meaningful to computers [that] will unleash a revolution of new possibilities.” Using HTML in a semantic, structural manner is one step toward the Semantic Web. So, avoid using a `blockquote` element just to indent text. You will learn modern techniques to configure margins and padding on elements later in this book.

## 2.11 Phrase Elements

**Phrase elements** indicate the context and meaning of the text between the container tags. It is up to each browser to interpret that style. Phrase elements are displayed right in line with the text (referred to as **inline display**) and can apply to a section of text or even just a single character of text. For example, the `<strong>` element indicates that the text associated with it has strong importance and should be displayed in a “strong” manner in relation to normal text on the page. Table 2.1 lists common phrase elements and examples of their use. Notice that some tags, such as `<cite>` and `<dfn>`, result in the same type of display (italics) as the `<em>` tag in popular browsers. These tags semantically describe the text as a citation or definition, but the physical display is usually italics in both cases.

**Table 2.1** Phrase elements

Element	Example	Usage
<code>&lt;abbr&gt;</code>	WIPO	Identifies text as an abbreviation; configure the title attribute with the full name
<code>&lt;b&gt;</code>	<b>bold</b> text	Text that has no extra importance, but is styled in bold font by usage and convention
<code>&lt;cite&gt;</code>	<i>cite</i> text	Identifies a citation or reference; usually displayed in italics
<code>&lt;code&gt;</code>	code text	Identifies program code samples; usually a fixed-space font
<code>&lt;dfn&gt;</code>	<i>dfn</i> text	Identifies a definition of a word or term; usually displayed in italics
<code>&lt;em&gt;</code>	<i>emphasized</i> text	Causes text to be emphasized in relation to other text; usually displayed in italics
<code>&lt;i&gt;</code>	<i>italicized</i> text	Text that has no extra importance, but is styled in italics by usage and convention
<code>&lt;kbd&gt;</code>	kbd text	Identifies user text to be typed; usually a fixed-space font
<code>&lt;mark&gt;</code>	mark text	Text that is highlighted in order to be easily referenced
<code>&lt;samp&gt;</code>	samp text	Shows program sample output; usually a fixed-space font
<code>&lt;small&gt;</code>	small text	Legal disclaimers and notices (“fine print”) displayed in small font size
<code>&lt;strong&gt;</code>	<b>strong</b> text	Strong importance; causes text to stand out from surrounding text; usually displayed in bold
<code>&lt;sub&gt;</code>	sub text	Displays a subscript as small text below the baseline
<code>&lt;sup&gt;</code>	sup text	Displays a superscript as small text above the baseline
<code>&lt;var&gt;</code>	var text	Identifies and displays a variable or program output; usually displayed in italics
