To teachers

You did not choose your profession to make a world of money, but instead to make a world of difference in the lives of your students. Thank you! —Rich and Jo Anne Vacca

To my family

who departed the Old Country for Ellis Island and the hope of a new life in America: Janko, Marko, Jela, Toma, Barbara, William, Helen, Anthon, Ursula, and Nikola. They are remembered here with gratitude and love. —*Maryann Mraz* This page is intentionally left blank

About the Authors

Richard and Jo Anne Vacca are Professors Emeriti in the School of Teaching, Learning, and Curriculum Studies in the College of Education, Health, and Human Services at Kent State University. They have published numerous books, chapters, and articles. They met as undergraduate English majors at SUNY Albany and have been partners ever since. Jo Anne taught language arts in middle schools in New York and Illinois and received her doctorate from Boston University. Rich taught high school English and earned his doctorate at Syracuse University. He is a past president of the International Reading Association.

Maryann Mraz is a Professor in the Reading and Elementary Education Department at the University of North Carolina at Charlotte (UNCC). She earned her Ph.D. from Kent State University and her B.A. and M.Ed. from John Carroll University, where she was awarded the Distinguished Alumni Educator Award in 2014. Maryann has served as a board member of the Association of Literacy Educators and Researchers (ALER) and as the Doctoral Program Director for Curriculum and Instruction at UNCC. She is the author of more than 70 books, articles, chapters, and instructional materials on literacy education. Maryann teaches bachelors, masters, and doctoral courses in literacy education and provides professional development programs to teachers and literacy coaches.

Preface

About this Book

The 13th edition of *Content Area Reading: Literacy and Learning across the Curriculum* continues to reflect an ever-expanding knowledge base grounded in research and practice in the areas of content literacy, instructional scaffolding, differentiated instruction, student diversity, and new literacies. It continues to emphasize a contemporary, functional approach to content literacy instruction. In a functional approach, content area teachers learn how to integrate literacy-related strategies into instructional routines without sacrificing the teaching of content. Our intent is not to morph a content teacher into a reading specialist or writing instructor. Rather, our goal has always been, and shall continue to be, to improve the overall coverage of instructional strategies and practices that remain at the heart of this book.

New to This Edition

In this edition, chapter content has been rigorously updated to reflect current theory, research, and practice related to literacy and learning across the curriculum. New and updated content and features of this text include the following:

- Expanded emphasis on what it means to be literate in an age of ever-increasing **new literacies**. See Chapters 2, 9, and 10.
- New suggestions for supporting **English Learners** in comprehending content area vocabulary and texts. See Chapter 6, Box 6.1: "Evidence-Based Practices: The Intersections of Literacy and Culture"; Chapter 7, Box 7.2: "Supporting English Learners"; and in Chapter 8, Box 8.1: "Voices from the Field" on the challenges of differentiating instruction and Box 8.5: "Supporting English Learners."
- Attention to the use of **formative assessment** to support data-based instructional decision making. See Chapter 4.
- An expanded emphasis on and new examples of **learning with multiple texts**, including both classic and contemporary adolescent literature. See Chapters 5 and 11.
- Updated **disciplinary literacy** features in many chapters to show how teachers adapt various aspects of content literacy instruction to meet the demands and peculiarities of their disciplines. See Chapter 7, Box 7.4: "Using Discipline Literacy with Project Planning in a Business Classroom," and Chapter 9, Box 9.4: "Using Disciplinary Literacy to Explore the Real-Life Tasks of a Multimedia Story Teller."
- Updated Voices from the Field features in many chapters. This feature captures the challenges that instructional team members have encountered relative

to chapter topics and the strategies used to address those challenges. See Chapters 1, 2, 3, 6, and 8. Many **instructional examples** have been replaced and updated throughout the text.

Key Content Updates by Chapter

Updates of new research and ways of thinking about literacy, learning, and instructional practice appear throughout the chapters. Updated content and features by chapter include the following:

- Chapter 1, Literacy Matters, is updated to reflect changes in education policy and standards. A new Voices from the Field segment presents the perspective of an instructional coach supporting content area teachers as they respond to these changes. The chapter discusses using technology integration to support collaborative learning across content areas.
- Chapter 2, Learning with New Literacies, reflects the prevalence of technology in schools and provides numerous new strategies and models, such as SAMR and the TPACK Framework, for integrating technology into content area classrooms. We offer suggestions for integrating social media tools in ways that increase digital citizenship and responsibility among students.
- Chapter 3, Culturally Responsive Teaching in Diverse Classrooms, is expanded to include a more detailed analysis of culturally relevant pedagogy and teaching for cultural understanding. We have included new strategies for supporting culturally and linguistically diverse students and have added a new Voices from the Field segment on using technology to support literacy development.
- Chapter 4, Assessing Students and Texts, discusses emergent content standards and their impact on assessment and data-driven instruction. The chapter is enhanced with new strategies for information assessment, a discussion of a formative assessment teaching cycle, and a framework for integrating data collection and instructional decision making.
- Chapter 5, Planning Instruction for Content Literacy, contains updated information on incorporating academic vocabulary in lesson planning and offers numerous updating strategy applications, including those for collaborative interactions and group investigations.
- Chapter 6, Activating Prior Knowledge and Interest, contains a new Evidence-Based Practices box on "The Intersections of Literacy and Culture" as well as a new Voices from the Field segment from the perspective of a first-year teacher who applies multimedia methods to activate students' prior knowledge and interest.

- Chapter 7, Guided Reading Comprehension, offers new suggestions for supporting English Learners and a new Disciplinary Literacy Box that applies disciplinary literacy principles to project planning in a business class. New, updated examples are offered for the QAR strategy.
- Chapter 8, Developing Vocabulary and Concepts, includes new content for supporting English Learners, a New Voices from the Field segment from the perspective of a high school English teacher working to meet the diverse vocabulary needs of her students, and new strategy application examples.
- Chapter 9, Writing Across the Curriculum, includes new information on applying disciplinary literacy principles to real-life tasks through multimedia story telling. Updated strategy examples are offered throughout the chapter.
- Chapter 10, Studying Text, contains many new examples of literacy applications across content areas. It includes a discussion of electronic text structure as it relates to studying text.
- Chapter 11, Learning with Multiple Texts, incorporates updated, research-based strategies for teaching with contemporary literature that addresses complex topics. The chapter broadens its emphasis to include multiple texts, graphic nonfiction, e-books, and databases. It includes expanded suggestions for strategy applications, especially with new technologies.

MyLab Education

One of the most visible changes, and one of the most significant in the 13th edition, is the expansion of the digital learning and assessment resources embedded in the e-text and the inclusion of MyLab Education in the text. MyLab Education is an online homework, tutorial, and assessment program designed to engage learners and improve learning. Within its structured environment, learners see key concepts demonstrated through real classroom video footage, practice what they learn, test their understanding, and receive feedback to guide their learning and to ensure their mastery of key learning outcomes. Designed to bring learners more directly into the world of content area classrooms and to help them see the real and powerful impact of ideas covered in this book, the online resources in MyLab Education with the Enhanced eText include:

• Video Examples. Three or four times per chapter, an embedded video provides an illustration of important

ideas in action. These video examples illustrate students and teachers working in classrooms and also describe how students and their teachers wrestle with challenges and dilemmas they encounter in classrooms.

- Self-Checks. In each chapter, self-check quizzes help assess how well learners have mastered the content. The self-checks are made up of self-grading, multiple-choice items that not only provide feedback on whether questions are answered correctly or incorrectly but also provide rationales for both correct and incorrect answers.
- Application Exercises. These exercises give learners opportunities to practice applying the content from the chapters. The questions in these exercises are usually constructed responses. Once learners provide their own answers to the questions, they receive feedback in the form of model answers written by experts.

Organization and Features of This Edition

As part of the revision process for this edition, we decided to keep the same structure as the previous edition by organizing chapters into two main parts. Part I, "Learners, Literacies, and Texts," places the focus on the cultural, linguistic, and academic diversity of today's learners, their personal and academic literacies, and the kinds of texts that are integral to their lives in and out of school. Part II, "Instructional Practices and Strategies," contains a multitude of evidence-based instructional strategies waiting to be adapted to meet the conceptual demands inherent in disciplinary learning.

Changes are interwoven throughout the e-text and the traditional print edition in the form of new disciplinary literacy boxes, new Voices from the Field segments, updated content in many of the chapters, updated references, and new examples of instructional strategies. This edition is enhanced by new online resources in the MyLab Education in the Enhanced E-text, including video examples, self-check assessments, and application exercises. These activities and strategies are powerful tools for supporting students as they think and learn with text.

This edition of *Content Area Reading* retains many of the features of the previous edition while improving its overall coverage of content literacy topics. In every chapter, special pedagogical features are provided to aid in this effort.

Features at the beginning of each chapter include the following:

The **Organizing Principle** provides readers with a "heads-up" by introducing the rationale for the chapter and highlighting its underlying theme.

 Learning Outcomes reflect the major objectives of the chapter under study.

> ▼ Graphic organizer depicts the relationships among ideas presented in the chapter.

Organizing Principle

New literacies have transformed the way we read, write, think, communicate, and make meaning.

In many ways, the universe serves as a metaphor for the human mind. It is never ending, ever expanding, and unfathomable. So is the human mind, Literacy has a powerful impact on the

Chapter 1 Literacy Matters 3 rerse of our minds. Through literacy, ink more deeply about images and

This need not be the case. The organizing principle of this chapter underscores the dy-namic relationship between literacy and learning: Effective teachers show students how to think, learn, and communicate with all kinds of texts. Study the Chapter Overview. It's your map to the major ideas that you will encounter in the chapter. The graphic display shows the relationships that exist among the concepts you

the chapter. The graphic display shows the relationships that exist among the concepts you will study. Use it as an organize: MWA that is the chapter about? What do you need to learn more about? How will you implement the presented information and concepts in your own practice? In conjunction with the Chapter Overview, take a moment or two to study the Frame of Mind questions. This feature uses key questions to help you think about the ideas that you will read about. When you finish reading, you should be able to respond fully to the Frame of Mind questions. instruction, and learning

Frame of Mind

- 1. What is the difference between content and process knowledge? What are the characteristics of effective teaching?
- How do content standards and content-driven planning and instruction affect literacy and learning in content areas?
- and rearing in content areas? Why is differentiated instruction an important aspect of content literacy and learning? What are new literacies, and how are they changing the way we think about learning and literacy in the 21st century?
- In what ways can technology aid instruction and support student literacy and learning? What is adolescent literacy, and why is it important to 21st-century society?
- How are content literacy and disciplinary literacy alike? How are they different?
 What comprehension strategies are critical to reading? What role does prior knowledge play in comprehension?
- What literacy strategies specifically target the challenges struggling and English Learners (ELs) readers face?

Teaching is an exercise in observation and response; there are no definitive formulas for teachers who want students to develop core concepts and good habits of thinking within a discipline. Nor are there magic potions in the form of instructional strategies that will make a difference with all students, all the time. Teaching is problem solving activity. There's just you; the academic texts and instructional strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students whose the solving strategies that you use; and the students whose the students the solving strategies that you use; and the students whose the students the solving strategies that you use; and the students whose the students the solving strategies that you use; and the students whose the students the solving strategies that you use; and the students the strategies that you use; and the students the strategies that you use; and the students the strategies that you use; and the strategies that you use; and the strategies that you use; and the students the s lives you briefly and, hopefully, positively impact. Teaching is a daunting but immensely re-warding enterprise for those who are up to the challenge.

Effective Teaching In Content Areas

1.1 Explain the characteristics of effective teachers and effective teaching, the difference between the two, and their impact on students and learning.

difference between use two, and user impact on stouents and scaring. Highly effective content area teachers plan lessons that are engaging and purposeful. These teachers recognize that "engaging the disengaged" is an essential, but difficult, task. Yet continually striving to make learning intellectually challenging and relevant for students makes teaching more effective and learning more stimulating. A top instruc-tional priority, therefore, is to involve students actively in learning the important ideas and concepts of the content they are studying. But the effective teacher also knows that an intellectually challenging instructional environment engages students not only in the acquisition of content but also in the *thinking processes* by which they learn that content.

Voices from the Field include interviews with teachers, administrators, and curriculum specialists related to instructional practices and policies.

Box 6.3 Voices from the Field

Drew. Mathematics Coach

Challenge During a unit on area and perimeter, a fifth-grade classroom teacher, Mrs. Little, and I posed a real-world mathematical task to students to allow them to explore these concepts more deeply. Here is the task they were given:

You have 12 yards of fencing to build a rectangular cage for your rabbit. Which dimensions give you the most space inside the cage?

Students often struggle with solving these types of mathematical tasks for a couple reasons: They struggle to read and make sense of the mathematical altatation, and, sometimes, they don't know where to begin. In this case, students struggled to distinguish between the concepts of perimeter (the amount of fencing) and area (the space inside).

Strategy

To support the students, Mrs. Little and I spent time at the be-ginning of the lesson activating their prior knowledge by asking them about real-life examples of area and perimeter. We posed questions such as:

- If we needed to build a fence, how would we determine how much fencing we would need?
- Can you think of other examples where we would need to figure out the distance around something?
- If we needed to put carpet down on the floor of a house, how would we determine how much carpet we would need? Can you think of other examples where we would need to figure out how much material we will need to cover a flat surface?

We posed the task to students and provided them with plastic square tiles to begin exploring the task. Initially, students connected the number 12 in the task with the need to grab 12 square tiles. Nearly every student did this and immediately made wide and 2 tiles tall, while others made nore that was 4 tiles wide and 3 tiles tall. While others made nore that was 4 tiles wide and 3 tiles tall. While others made nore that was 4 tiles wide and 3 tiles tall. While others made nore that was 4 tiles wide the start of the start. When the other made nore that was 4 tiles wide the start of the start. When the others made nore that was 4 tiles wide the start of the start. When the other made nore that was 4 tiles wide the start of the start. When the start of the start of

3 tiles tall. While both used 12 tres, neuron recording - - -meter of 12. Seeing this misconception, Mrs. Little and I revisited fents' understanding of perimeter by asking them a few

Mrs. Little: Do we know the amount of fencing that we have or the space that we have inside of our pen?

Linguistic Differences in Today's Schools 3.3 Explain the impact of linguistic diversity on content area instruction.

3.3 Explain the impact of linguistic diversity on content area instruction. Linguistic diversions samong today's student population are strikingly evident in many school districts throughout the United States. From the East Coast to the West Coast and from the Gulf to the northerm Great Lakes, the increasingly large number of immigrants from non-European nations is influencing how content area teachers approach instruc-tion. It's no exaggeration to suggest that in some large urban school districts, more than 175 different languages are spoken (Charlott-MeckGubmurg Schools, 2014). When immigrant students maintain a strong identification with their culture and na-tive language, they are more likely to succeed academically, and they have more positive self-concepts about their ability to learn (Banks, 2001; Daz, 2001; Garcia, 2002; Schools, howvere, tend to view linguistically diverse students whose first language is one other than English from a deficit model, not a difference model. For these English Learners, instruc-tional practices currently are compensatory in nature. That is, they are premised on the

English from a deficit model, not a difference model. For these English Learners, instruc-tional practices currently are compensatory in nature. "That is, hky are premised on the assumption that language diversity is an illness that needs to be cured." (Diaz, 2001, p. 159). In addition, regional variations in language usage, commonly known as dialects, are a complicated issue for teachers. In truth, as explained in Box 33, all English language users speak a dialect of English, which is rooted in such factors as ago, gender, socioeconomic status, and the region of the country where one was born and grew up. Even presidents of the ultra disperiod to dialects—the previewing domess or badness of one language varia-tion over another. Linguists explain that language variations are neither good nor bad and that such judgments are often about the popele whon make them rather than about clarity or precision (Abacm, 2012). Ger (2012) anguase quite convincingly that teachers need to respect and recognize the strengths of diverse learners who use dialects in the classroom is

learning tasks and activities for students to complete using Internet resources. WebQuests terming index and actuates of southern to comprete using interact testing tests recorders are typically organized around several components: introduction, task, process, resources, learning advice, and conclusion. The introduction to a WebQuest provides an overview of the learning opportunity available to the students. Often the introduction places the learner(s) in a hypothetical sit-

uation somewhat similar to RAFT writing activities (see Chapter 9). As a result, students amount somewing summing activities (see Campler), so a result, somewing activities (see Campler), so a result (see Campler), so a result of the second se WebQuest provides links to information resources on the Internet that students will need vectores provides must obmornation resources on the interfect that students with need to access to complete the learning task. The "learning advice" component provides direc-tions to students on how to organize information, whether in outlines, time lines, graphic organizers (see Chapter 10), notebook entries such as the double-entry journal format (see Chapter 5), or I-charts, And, finally, the conclusion to the WebOuest brings closure to the activity and summarizes what students should have learned from participation in the WebQuest.

Adapting Learning Strategies with Technology

Computers and digital technologies are both a "facilitator of knowledge and medium for literacy" (Biancarosa & Snow, 2004). Technology allows teachers to plan higher levels of differentiation and to meet the academic needs of a greater number of students during instruction. Electronic databases, such as EBSCO and ProQuest, provide middle and high school students a wealth of information at various degrees of reading difficulty, allowing

MyLab Education Response Journal 2.2 Consider how technology has evolved throughout your edu-cational experience as a studen and, perhaps, as a teacher. How has technology impacted your experiences in classrooms and schools and changed learning for you?

school students a weath of information at various upgrees or reading unitcuty, anowing teachers to find multiple texts related to course content. For example, ProQuest has created the ProQuest Central and STEM Database and EBSCO has Explora, search engines designed for middle and high school students. Explor and ProQuest Central provide adolescent learners with appropriate research tools for easily obtaining the information that they seek from these databases, including electronic magazines, newspapers, biographies, and videos. Students can also search da-tabases by topic and limit their searches according to appropriate *Lexile realing levels* (see Chapter 4 for a discussion of Lexile reading levels and other tools for determining the

Chapter 4 to a discussion of Lexae reading aevers and other toots for determining une readability of difficulty level of texts). Using electronic texts, content area teachers can create flexible groups within their classes that allow all students access to text appropriate to their needs and relevant to course objec-tives. In addition, interactive computer programs, such as Newsela and CommonLit, offer a range of textual material adapted to students' reading levels, while ReadWorks provides a range of nonfiction material for teachers to use with K-12 students. Many of these texts and websites adapt to a student's reading performance by providing text passages that are writ-ten at a level consistent with the student's needs. Doing so increases the comprehensibility ten at a level consistent with the student's needs. Joograms provide students with immediate feedback on assignments and allow teachers to track student progress toward goals outlined in intervention plans. Some programs that include voice recognition software allow students to record themselves while reading so that miscusce can be tracked and appropriate feedback provided. These resources can be useful for providing students with multiple interactions with the feedback of the second students of the second students with multiple interactions with the second students of the second students with multiple interactions with the second students of the second students with multiple interactions with the second students of the second students with multiple interactions with the second students and the second students with multiple interactions with the second students and the second students with multiple interactions with the second students and the second students with multiple interactions with the second students and the second students with multiple interactions with the second students and the second students with multiple interactions with the second students with

with texts and for offering independent practice Binaraosa & Snow, 2004). Many learning strategies such as KWL and RAFT can be adapted using Web 2.0 tech-nologies. For example, comprehension strategies such as KWL and 3-2-1 can be created in shared document sites like Google Drive. Teachers can post research and writing tools, such as I-charts and RAFT, to a Dropbox folder or their class wiki. Twitter can be used in place of question cards to generate questions for a class discussion

Here is a chart with digital adaptations of some of the strategies presented in this book.

Classroom Artifact figures throughout the book illustrate instructional procedures and materials developed by teachers for authentic teaching situations.

 Response Journal marginal icons signal readers to use a "response journal" while reading to make personal and professional connections as they react to ideas presented in each chapter.

Box 9.3 Evidence-Based Practices Authentic Writing With English Learners

Daniel (2017) reminds writing instructors that English Learners benefit from authentic writing experiences that are connected to their experiences. For example, an eight-ryade science class engaged in a unit study on the spread of classes. One of their writing assignments was to imagine that they worked for the Centers to Classes Control and Prevention (CDC). Their task was to catalog and categorize the diseases, their symptoms, and their curves. This class included several Hrmog students who had insteid prolicency with English. The task-reseted sight word

cards and corresponding picture cards of disease symptoms Capitalizing not not not not eighth-pacific facilitation with all things greasome but also picture/word associations, the Him students worked with the Ferglen-pacific pacific pacific to learn the vocabulary as they matched the sight word cards with the pictures. Next, they worked in amalignups to damatise symptoms that corresponded to a disease. The experience or palying there more helped all students to understand the na-ture of the diseases they were studying. This activity support

Chapters conclude with additional features that help readers review and practice the concepts introduced in the chapter:

Chapter 10 Studying Text 315

Texted Reading Guides

An engaged classroom provides an opportunity to learn and practice in authentic ways. One way to do this is to encourage students to use technology that usually resides out-side of the classroom, inside the classroom (Crawley 2015). Texted reading guides are one way to allow students to use their texting skills academically. An activity that is best done in groups of two, texted reading guides can either be an e-mail exchange or, more ideally, a text exchange. The learners work together to text or e-mail each other their notes. Just like an outline, they should organize their writing so that, when read back, it can reflect the structure of the texts. This process starts with one reader texting a title and the other texting the main point. This continues until all the main points have been explored. Here is an excerpt from an exchange about *The Outsiders*. The students were given the assignment to discuss how they felt about Ponyboy.

Student One: I like Ponyboy, but I think he is really naïve.

- Student Two: Why do you think that?
- Student One: I think he trusts people too much. Like when he is trusting his brothers to take care of excerpthing. I think he looks at them like they can do no wrong. That is naïve. Don't you think. Student Tuo: Yes I guess, but they are also family. Sometimes you have to believe in some-
- thing, right? If you can't believe in your family, what else do you have. I don't call that naïve, I call that loyal.

Then the process begins again with a new title and new points. Not only does this as signment allow students to express their opinions and points of comprehension authen-tically, but also their conversation is saved digitally. They can look back at their notes to study, ask questions, and recall important points. They can read and revise it in real time, and through the revision, it becomes a living document.

MyLab Education Self-Check 10.4

MyLab Education Application Exercise 10.4: Using Text Annotations in Content Area Classrooms

Looking Back Looking Forward

Teaching students how and why to study texts involves showing them how to become in-dependent learners. In this chapter, we used the role that text structure plays to illustrate how you can teach students to use learner-directed strategies that involve constructing graphic organizers, writing summaries, and making and taking notes. We also empha-

surprise organizets, virtuing summaring, and making and using noises. We also empairs sized the importance to connecting studying to authenic tasks and technologies. Understanding how authors organize their ideas is a powerful factor in learning with texts. Because authors write to communicate, they organize ideas to make them accessible to readers. A well-organized text is a considerate one. The text patterns that authors use to readers. A well-organized text is a considerate one. The text patterns that authors use to organize their ideas revolve around description, sequence, comparison and contrast, cause and effect, and problem and solution. The more students perceive text patterns, the more likely they are to remember and interpret the ideas they encounter in reading as they connect them with their cultural backgrounds and life experiences. Graphic organizers help students outline important information that is reflected in the text patterns that authors use to organize ideas. The construction of graphic organize res allows students to map the relationships that exist among the ideas presented in text. This strategy is a valuable tool for comprehending, retaining, and expressing information. Students who encore in summarizing what they have read often eain enzyter under-

Students who engage in summarizing what they have read often gain greater under standing and retention of the main ideas in text. Students need to become aware of summari-zation rules and to receive instruction in how to use these rules to write and polish a summary.

Part I Learners, Literacies, and Texts

Chapter 1 Literacy Matters

Written in collaboration with Melissa Sykes

Chapter Overview and Learning Outcomes

After reading this chapter, you should be able to:

- **1.1** Explain the characteristics of effective teachers and effective teaching, the difference between the two, and their impact on students and learning.
- **1.2** Explain how *literacy* has evolved and the classroom implications of 21st-century literacy.
- **1.3** Describe the factors influencing reading to learn in a discipline.

2 PART 1 Learners, Literacies, and Texts

Organizing Principle

New literacies have transformed the way we read, write, think, communicate, and make meaning.

In many ways, the universe serves as a metaphor for the human mind. It is never ending, ever expanding, and unfathomable. So is the human mind. Literacy has a powerful impact on the meaning-making and learning that take place in the universe of our minds. Through literacy, we begin to see, to imagine, to comprehend, and to think more deeply about images and ideas encountered in all kinds of texts. When it comes to learning in content areas, literacy matters. All teachers have a critical role and powerful opportunity to make a difference in the literate lives of their students. In this chapter, we explore what that role requires for effective teaching in the content areas. And in the process of doing so, we clarify several core concepts related to literacy, teaching, and learning: *teacher effectiveness, standards-based planning, differentiated instruction, new literacies, adolescent literacy, content/disciplinary literacy, reading to learn, and strategies to support high-needs learners.*

Though both preservice and content area teachers may question the need for a course that has the terms *reading* and/or *literacy* in its title, all teachers have an important role to play in showing students how to use literacy skills and strategies regardless of discipline or context. While many view their primary role as teaching the core ideas and concepts of their discipline, literacy is an evolving concept that changes with society over time. Content counts, but literacy is the foundation for content-specific comprehension! Perhaps it's best to think of literacy in terms of the *multiple literacies* that we use to make and communicate meaning. In this book, we explore how to support students' literacies by helping them make and communicate meaning with the various kinds of texts—both print and digital—they use in content areas.

Our primary emphasis throughout this book is on reading and writing to learn in middle and high school. Unfortunately, many adolescent learners struggle with academic texts. Teachers across all content areas will be faced with the task of supporting students' understanding and use of reading and writing as tools for thinking and learning. Many students either read or write on a superficial level or find ways to circumvent literacy tasks altogether; and all too often, adolescent learners give up on reading with the expectation that teachers will impart information through lecture, demonstration, and class discussion. When students become too dependent on teachers as their primary source of information, they are rarely in a position to engage in active literacy for learning. This need not be the case. The organizing principle of this chapter underscores the dynamic relationship between literacy and learning: Effective teachers show students how to think, learn, and communicate with all kinds of texts.

Study the Chapter Overview. It's your map to the major ideas that you will encounter in the chapter. The graphic display shows the relationships that exist among the concepts you will study. Use it as an organizer. What is the chapter about? What do you know already about the content to be presented in the chapter? What do you need to learn more about? How will you implement the presented information and concepts in your own practice?

In conjunction with the Chapter Overview, take a moment or two to study the Frame of Mind questions. This feature uses key questions to help you think about the ideas that you will read about. When you finish reading, you should be able to respond fully to the Frame of Mind questions.

Frame of Mind

- 1. What is the difference between content and process knowledge?
- 2. What are the characteristics of effective teaching?
- 3. How do content standards and content-driven planning and instruction affect literacy and learning in content areas?
- 4. Why is differentiated instruction an important aspect of content literacy and learning?
- 5. What are new literacies, and how are they changing the way we think about learning and literacy in the 21st century?
- 6. In what ways can technology aid instruction and support student literacy and learning?
- 7. What is adolescent literacy, and why is it important to 21st-century society?
- 8. How are content literacy and disciplinary literacy alike? How are they different?
- **9.** What comprehension strategies are critical to reading? What role does prior knowledge play in comprehension?
- 10. What literacy strategies specifically target the challenges struggling and English Learners (ELs) readers face?

Teaching is an exercise in observation and response; there are no definitive formulas for teachers who want students to develop core concepts and good habits of thinking within a discipline. Nor are there magic potions in the form of instructional strategies that will make a difference with all students, all the time. Teaching is a problem-solving activity: There's just you; the academic texts and instructional strategies that you use; and the students whose lives you briefly and, hopefully, positively impact. Teaching is a daunting but immensely rewarding enterprise for those who are up to the challenge.

Effective Teaching in Content Areas

1.1 Explain the characteristics of effective teachers and effective teaching, the difference between the two, and their impact on students and learning.

Highly effective content area teachers plan lessons that are engaging and purposeful. These teachers recognize that "engaging the disengaged" is an essential, but difficult, task. Yet continually striving to make learning intellectually challenging and relevant for students makes teaching more effective and learning more stimulating. A top instructional priority, therefore, is to involve students actively in learning the important ideas and concepts of the *content* they are studying. But the effective teacher also knows that an intellectually challenging instructional environment engages students not only in the acquisition of content but also in the *thinking processes* by which they learn that content.

Response Journal 1.1 Write a "five-minute essay" in your response journal on your initial reaction to standards-based planning, instruction, and learning. No wonder the classroom is like a crucible, a place where the special mix of teacher, student, and text come together to create wonderfully complex human interactions that stir the minds of learners. Some days, of course, are better than others. The things that you thought about doing and the classroom surprises that you didn't expect fall into place. A creative energy imbues teaching and learning.

Sometimes, however, lessons limp along. Others simply bomb—so you cut them short. The four or so remaining minutes before the class ends are a kind of self-inflicted wound. Nothing is more unnerving than waiting for class to end when students don't have anything meaningful to do. During this time the silence can be deafening, and behavior management can become overwhelming.

Consider a high school science teacher's reflection on the way things went in one of her chemistry classes. "Something was missing," she explains. "The students aren't usually as quiet and passive as they were today. Excuse the pun, but the chemistry wasn't there. Maybe the text assignment was too hard. Maybe I could have done something differently. Any suggestions?"

This teacher's spirit of inquiry is admirable. She shows she knows her students and wants them to succeed; she also wants to know how to improve her teaching—how to engage students in learning the important concepts of her chemistry course and how to involve them in thinking like scientists.

Like all good teachers, the chemistry teacher in the preceding example cares about *what* she does and *how* she does it. *Content* and *process*, after all, are two sides of the same instructional coin. She knows a lot about the *what* of instruction—the content of chemistry—and how to teach that content in ways that develop important ideas and concepts in an intellectually challenging instructional environment. A strong attraction to academic content is one of the reasons teachers are wedded to a particular discipline. Yet it is often much more difficult to teach something than to know that something: "The teacher of the American Revolution must know both a great deal about the American Revolution to a wide variety of students, in a pedagogically interesting way" (Shulman, 1987, p. 5). While a teacher's passion may lie with the content, the instruction of that content requires more skill and finesse.

Teaching is complicated. There are no shortcuts to effective teaching in content areas. Often, what to teach (content) and how to teach it (process) represent nagging problems for today's teachers. Despite pacing guides and standardized programs, the specific what and how of teaching is dependent on individual student needs, and quality instruction of the content is vital. On one hand, researchers have shown that subject matter mastery is essential for effective teaching (Allen, 2003; Sanders, 2004; Walsh & Snyder, 2004). Indeed, a strong connection exists between teachers' content knowledge preparation and higher student achievement.

The Educational Testing Service (ETS) study *How Teaching Matters* (Wenglinski, 2000) concluded, not surprisingly, that teachers' content knowledge is an important factor in student achievement. Content counts! Student achievement, for example, increases by 40% of a grade level in both mathematics and science when teachers have a major or minor in the subject. However, the study also concluded that content knowledge alone is not the only factor necessary to help increase student achievement. Indeed, the classroom instructional practices and strategies of teachers significantly influence student achievement. The study found that students who engage in active, hands-on learning activities and respond to higher-order thinking questions outperform their peers by more than 70% of a grade level in mathematics and 40% in science. In addition, the study showed that students whose teachers have received professional development training in working with special populations outperform their peers by more than a full grade level. The findings of the ETS study indicate that greater attention, not less, needs to be paid to improving the pedagogical knowledge of teachers and the classroom aspects of teacher effectiveness.

What Makes a Teacher Effective?

The U.S. Department of Education (2010), readily acknowledges that the "most important factor" in student success is the teacher. When students have access to effective teachers in the classroom, not only can achievement gaps narrow, but students will approach literacy and learning tasks with purpose and enthusiasm. Realistically, however, even in classrooms where teachers are practicing their craft effectively, some students will zone out from time to time or become sidetracked with other matters. Ball and Forzani (2010) put it this way in describing the difference between a tutor working one on one with a learner and a teacher working with an entire class of learners:

Not only do teachers have more learners to understand and interact with, but they also must design and manage a productive environment in which all are able to learn. One student requires a firm hand and a great deal of direction whereas another works best when left to puzzle further on his own. One student is active tapping her pen, doodling, and rocking on her chair—even while deeply engaged whereas a second is easily distracted. (p. 42)

Yet in the presence of an effective teacher most learners will tune in to what they are studying in the classroom—and stay tuned in.

With today's focus on educational reform, teacher effectiveness is closely tied to student achievement. An effective teacher has been defined as one whose students' growth is equivalent to at least one grade level in an academic year (U.S. Department of Education, 2009). Linda Darling-Hammond (2006) expands the notion of teacher effectiveness beyond how well students perform on achievement measures. She suggests that it is important to keep in mind the distinction between *teacher quality* and *teaching quality*. She defines teacher quality as the traits, understandings, and characteristics an effective teacher brings to instruction, including the following:

- Strong general intelligence and verbal ability that help teachers organize and explain ideas as well as observe and think diagnostically
- Strong content knowledge
- Knowledge of how to teach others; how to use hands-on learning techniques and how to develop higher-order thinking skills
- An understanding of learners and their learning and development—including how to assess and scaffold learning, how to support students who have learning differences or difficulties, and how to support the learning of language and content for those who are not already proficient in the language of instruction
- Adaptive expertise that allows teachers to make judgments about what it is like to work in a given context in response to student needs (Darling-Hammond, 2006, p. 2)

Teaching quality, on the other hand, has more to do with the context of instruction. Quality teaching enables a teacher to meet the demands of a discipline and to provide "strong instruction" that allows a wide range of students to learn.

Pearson and Hoffman (2011) also discuss teaching quality and strong instruction from the perspective of what it means to be a practicing teacher. They describe practicing teachers as *thoughtful, effective, pragmatic,* and *reflective*. In the classroom, the actions of a practicing teacher are guided by ten general "principles of practice" associated with teaching quality. Effective teachers reflect and are guided by these principles in their daily work in the classroom. These principles of practice are summarized in Table 1.1.

Higher levels of student achievement, Pearson and Hoffman (2011) contend, will not result from mandated standards or high-stakes testing alone. While standards and highstakes assessment are an integral part of today's educational landscape, practicing teachers, who know how to balance content and process in a standards-based curriculum, are the real game changers in the education of 21st-century learners.

Table 1.1 Ten General Principles of Practice Associated With Quality Teaching

- Principle of Praxis: Effective teachers act on the understanding that education has the power to transform the individual and society.
- Principle of Purpose: Effective teachers
 operate in the moment guided by a clear under standing of why they are doing what they are
 doing. There is always a purpose behind their
 actions in the classroom.
- 3. Principle of Serendipity: Although effective teachers engage in a variety of instructional practices, they "expect the unexpected" and are open to learning opportunities that may occur within the context of instruction.
- Principle of Exploration: Effective teachers are continually exploring new practices and making changes in their practices based on their exploration of instructional possibilities in the classroom.
- 5. Principle of Reflection: Effective teachers think about the *what, how,* and *why* of instruction during and after each teaching activity. They engage in the process of reflection to solve instructional problems and set goals.

- Principle of Community: Effective teachers share their classroom knowledge and experiences within and across multiple professional communities as a means of growing professionally and giving back.
- 7. *Principle of Service:* Effective teachers serve the learners in their classrooms and their parents.
- 8. *Principle of Flexibility:* Effective teachers plan instruction but are flexible in the implementation of lessons. They adapt to unanticipated events or responses in ways that make learning possible.
- **9.** *Principle of Caring:* Effective teachers care about the learners in their classroom, the disciplinary content that they teach, and the literacy processes they use to make a difference in the lives of students. Caring is necessary to build relationships essential to the teaching/learning transaction.
- **10.** *Principle of Reward:* Effective teachers find satisfaction and reward in what they do for their students; they value the spontaneity of classroom life, the immediacy of the classroom, the learning they are a part of, and the autonomy of making instructional decisions.

Effective Teachers and the Standards-Driven Classroom

Literacy and learning are challenges in today's classrooms, where the demands inherent in the teaching of content standards can easily lead to "covering" information without much attention given to *how* students with a wide range of skills and abilities acquire core concepts. Schools continue to question the curriculum choices made in their classrooms. Curriculum refers to the content taught, which resources and strategies are used, and the learning activities in which students are engaged (Dunkle, 2012). Building or employing a curriculum that balances content and process in a standards-based curriculum means at the very least:

- Knowing the standards for your content area and grade level
- Making instructional decisions based on authentic assessments throughout the school year about students' abilities to use reading and writing to learn
- Integrating content literacy practices and strategies into instructional plans and units of study

Standards, in a nutshell, are expected academic consequences defining what students should learn and how they should learn it at designated grade levels and in content areas. Since the mid-1990s, a proliferation of state standards have provided a road map to what students *should know* and *be able to do* at each grade level and for each content area.

The underlying rationale for the creation of standards is that high learning expectations—clearly stated and specific in nature—will lead to dramatic changes in student achievement. With high learning expectations comes an accountability system based on "high-stakes" testing to determine how well students meet the standards formulated in each content area. The goal is purposeful instruction with clear data points that allow teachers to identify if students have learned what they aimed to teach and to determine what their students know. Some states tie high-stakes assessment to the threat of grade-level retention for students who perform below predetermined levels of proficiency in critical areas such as reading. We explore in more detail the nature of high-stakes assessment, and the types of authentic assessments to improve learning, in Chapter 4.
