About the Authors

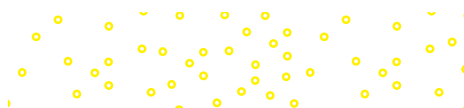

©William Navidi

William Navidi is a professor of Applied Mathematics and Statistics at the Colorado School of Mines in Golden, Colorado. He received a Bachelor's degree in Mathematics from New College, a Master's degree in Mathematics from Michigan State University, and a Ph.D. in Statistics from the University of California at Berkeley. Bill began his teaching career at the County College of Morris, a two-year college in Dover, New Jersey. He has taught mathematics and statistics at all levels, from developmental through the graduate level. Bill has written two Engineering Statistics textbooks for McGraw Hill. In his spare time, he likes to play racquetball.

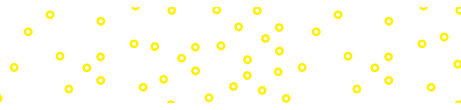

©Dawn Sherry

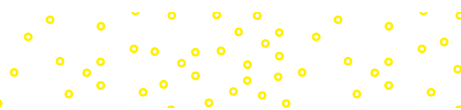

Barry Monk is a Professor of Mathematics at Middle Georgia State University in Macon, Georgia. Barry received a Bachelor of Science in Mathematical Statistics, a Master of Arts in Mathematics specializing in Optimization and Statistics, and a Ph.D. in Applied Mathematics, all from the University of Alabama. Barry has been teaching Introductory Statistics since 1992 in the classroom and online environments. Barry has a minor in Creative Writing and is a skilled jazz pianist.

CHAPTER 1 Basic Ideas 1

Tatiana Grozetskaya/Shutterstock

- 1.1** Sampling 2
- 1.2** Types of Data 12
- 1.3** Design of Experiments 19
- 1.4** Bias in Studies 27
- Chapter 1 Summary 31
- Vocabulary and Notation 31
- Chapter Quiz 32
- Review Exercises 32

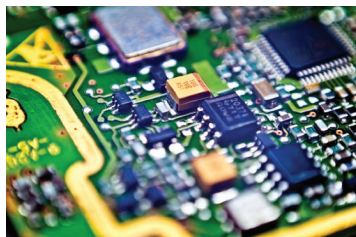

CHAPTER 2 Graphical Summaries of Data 37

Mike Flippo/123RF

- 2.1** Graphical Summaries for Qualitative Data 38
- 2.2** Frequency Distributions and Their Graphs 51
- 2.3** More Graphs for Quantitative Data 71
- 2.4** Graphs Can Be Misleading 83
- Chapter 2 Summary 90
- Vocabulary and Notation 90
- Chapter Quiz 91
- Review Exercises 92

CHAPTER 3 Numerical Summaries of Data 97

adistock/123RF

- 3.1** Measures of Center 98
- 3.2** Measures of Spread 118
- 3.3** Measures of Position 139
- Chapter 3 Summary 158
- Vocabulary and Notation 158
- Chapter Quiz 159
- Review Exercises 160

CHAPTER 4 Summarizing Bivariate Data 165

Stockbyte/PunchStock

- 4.1** Correlation 166
- 4.2** The Least-Squares Regression Line 178
- 4.3** Features and Limitations of the Least-Squares Regression Line 190
- Chapter 4 Summary 204
- Vocabulary and Notation 204
- Chapter Quiz 205
- Review Exercises 206

CHAPTER 5 Probability 213

Ryan McVay/Getty Images

- 5.1** Basic Concepts of Probability 214
- 5.2** The Addition Rule and the Rule of Complements 226
- 5.3** Conditional Probability and the Multiplication Rule 235
- 5.4** Counting 248
- Chapter 5 Summary 257
- Vocabulary and Notation 257
- Chapter Quiz 258
- Review Exercises 259

CHAPTER 6 Discrete Probability Distributions 263

Andriy Popov/123RF

- 6.1** Random Variables 264
- 6.2** The Binomial Distribution 278
- 6.3** The Poisson Distribution 290
- Chapter 6 Summary 296
- Vocabulary and Notation 297
- Chapter Quiz 297
- Review Exercises 298

CHAPTER 7 The Normal Distribution 303

Preface

This book is designed for an introductory course in statistics. In addition to presenting the mechanics of the subject, we have endeavored to explain the concepts behind them, in a writing style as straightforward, clear, and engaging as we could make it. As practicing statisticians, we have done everything possible to ensure that the material presented is accurate and correct. We believe that this book will enable instructors to explore statistical concepts in depth yet remain easy for students to read and understand.

To achieve this goal, we have incorporated a number of useful pedagogical features:

Features

- **Check Your Understanding Exercises:** After each concept is explained, one or more exercises are immediately provided for students to be sure they are following the material. These exercises provide students with confidence that they are ready to go on, or alert them to the need to review the material just covered.
- **Explain It Again:** Many important concepts are reinforced with additional explanation in these marginal notes.
- **Real Data:** Statistics instructors universally agree that the use of real data engages students and convinces them of the usefulness of the subject. A great many of the examples and exercises use real data. Some data sets explore topics in health or social sciences, while others are based in popular culture such as movies, contemporary music, or video games.
- **Integration of Technology:** Many examples contain screenshots from the TI-84 Plus calculator, MINITAB, and Excel. Each section contains detailed, step-by-step instructions, where applicable, explaining how to use these forms of technology to carry out the procedures explained in the text.
- **Interpreting Technology:** Many exercises present output from technology and require the student to interpret the results.
- **Write About It:** These exercises, found at the end of each chapter, require students to explain statistical concepts in their own words.
- **Case Studies:** Each chapter begins with a discussion of a real problem. At the end of the chapter, a case study demonstrates applications of chapter concepts to the problem.
- **In-Class Activities:** At the end of each chapter, activities are suggested that reinforce some concepts presented in the chapter.

Flexibility

We have endeavored to make our book flexible enough to work effectively with a wide variety of instructor styles and preferences. We cover both the P -value and critical value approaches to hypothesis testing, so instructors can choose to cover either or both of these methods. The material on two-sample inference is divided into two chapters—Chapter 10 on two-sample confidence intervals, and Chapter 11 on two-sample hypothesis tests. This gives instructors the option of covering all the material on confidence intervals before starting hypothesis testing, by covering Chapter 10 immediately after Chapter 8.

We have placed the material on descriptive statistics for bivariate data immediately following descriptive statistics for univariate data. Those who wish to cover bivariate description and inference together may postpone Chapter 4 until sometime before covering Chapter 13.

Instructors differ widely in their preferences regarding the depth of coverage of probability. A light treatment of the subject may be obtained by covering Section 5.1 and skipping the rest of the chapter. More depth can be obtained by covering Sections 5.2 and 5.3. Section 5.4 on counting can be included for an even more comprehensive treatment.

Supplements

Supplements, including a Corequisite Workbook, online homework, videos, guided student notes, and PowerPoint presentations, play an increasingly important role in the educational process. As authors, we have adopted a hands-on approach to the development of our supplements, to make sure that they are consistent with the style of the text and that they work effectively with a variety of instructor preferences. In particular, our online homework package offers instructors the flexibility to choose whether the solutions that students view are based on tables or technology, where applicable.

New in This Edition

The fourth edition of the book is intended to extend the strengths of the third. Some of the changes are:

- Discussions of the investigative process of statistics have been added, in accordance with recommendations of the GAISE report.
- In-class activities have been added to each chapter.
- Material on the ratio and interval levels of measurement have been added.
- Material on bell-shaped histograms has been added.
- A discussion of the use of sample means to estimate population means has been added.
- Material on the uniform distribution has been added.
- A new objective on the reasoning used in hypothesis testing has been added.
- New conceptual exercises regarding assumptions in constructing confidence intervals and performing hypothesis tests have been added.
- Additional material on Type I and Type II errors has been added.
- Objectives on the relationship between confidence intervals and the margin of error, calculating the sample size needed for a confidence interval of a given width, and the difference between confidence and probability are now presented in a context where the population standard deviation is unknown.
- Objectives on the relationship between confidence intervals and hypothesis tests, the relationship between the level of a test and the probability of error, the importance of reporting P -values, and the difference between statistical and practical significance are now presented in a context where the population standard deviation is unknown.
- Material on confidence intervals and hypothesis tests for paired samples now immediately follows the corresponding material for independent samples.
- Material on hypothesis tests for the population correlation has been added.
- A large number of new exercises have been included, many of which involve real data from recent sources.
- A large number of new exercises have been added to the online homework system. These include new conceptual questions and stepped-out solutions for the TI-84 Plus calculator and Excel.
- Several of the case studies have been updated.
- The exposition has been improved in a number of places.

William Navidi

Barry Monk

Acknowledgments

We are indebted to many people for contributions at every stage of development. Colleagues and students who reviewed the evolving manuscript provided many valuable suggestions. In particular, Charla Baker, John Trimboli, Don Brown, and Duane Day contributed to the supplements, and Mary Wolfe helped create the video presentations. Ashlyn Munson contributed a number of exercises, Abby Noble, Lindsay Lewis, and Ryan Melendez contributed many valuable ideas for revisions, and Tim Chappell played an important role in the development of our digital content.

The staff at McGraw Hill has been extremely capable and supportive. Project Manager Jeni McAtee was always patient and helpful. We owe a debt of thanks to Emily DiGiovanna, Debbie McFarland, and Mary Ellen Rahn for their creative marketing and diligence in spreading the word about our book. We appreciate the guidance of our editors, Chrissy Skogen and Megan Platt, whose input has considerably improved the final product.

William Navidi
Barry Monk

Feedback from Statistics Instructors

Paramount to the development of *Elementary Statistics* was the invaluable feedback provided by the instructors from around the country who reviewed the manuscript while it was in development.

Personalized for your students,
flexible for your approach.

Every student has different needs and enters your course with varied levels of preparation. ALEKS® pinpoints what students already know, what they don't and, most importantly, what they're ready to learn next. ALEKS® provides flexibility and control when shaping your course so you can reach every student.

ALEKS® Keeps Students Focused with a Personalized Learning Path

ALEKS® creates an optimized path with an ongoing cycle of learning and assessment, celebrating students' small wins along the way with positive real-time feedback. Rooted in research and analytics, ALEKS® improves student outcomes by fostering better preparation, increased motivation and knowledge retention.

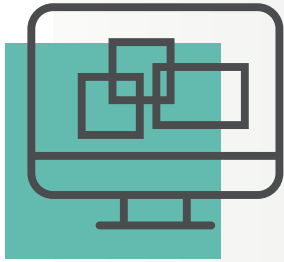

Your Course, Your Way

In a single platform, ALEKS® provides a balance of personalized, adaptive practice and non-adaptive assignments for application and assessment. This supports students individually while allowing you to create assignments that align to your course goals.

By differentiating instruction for students, ALEKS® unlocks the power of instructional time, group work, and applications and prepares students to make real-world connections.

//CODiE//
2019 SIIA CODiE WINNER

Flexible Implementation

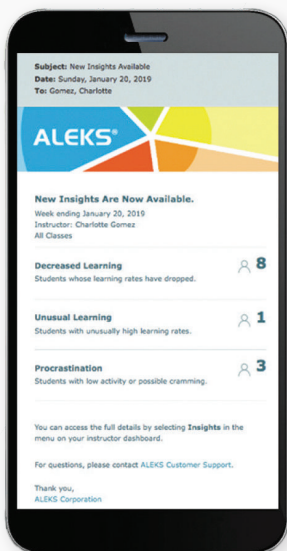

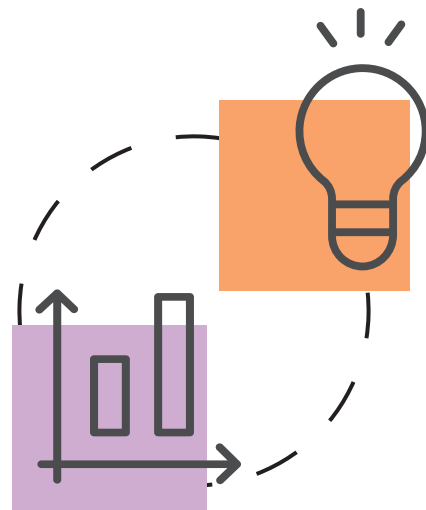

ALEKS® enables you to structure your course regardless of your instruction style and format. From a traditional classroom, to various corequisite models, to an online prep course before the start of the term, ALEKS® can supplement your instruction or play a lead role in delivering the content.

Teaching online? Respondus integration with ALEKS® supports secure testing with LockDown Browser and Respondus Monitor for Tests, Quizzes, and Scheduled Knowledge Checks.

Outcomes & Efficacy

Our commitment to improve student outcomes services a wide variety of implementation models and best practices, from lecture-based to labs and corequisites to summer prep courses. Our case studies illustrate our commitment to help you reach your course goals and our research demonstrates our drive to support all students, regardless of their math background and preparation level.

*visit bit.ly/outcomesandefficacy to review empirical data from ALEKS® users around the country

Turn Data Into Actionable Insights

ALEKS® Reports are designed to inform your instruction and create more meaningful interactions with your students when they need it the most. ALEKS® Insights alert you when students might be at risk of falling behind so that you can take immediate action. Insights summarize students exhibiting at least one of four negative behaviors that may require intervention including Failed Topics, Decreased Learning, Unusual Learning and Procrastination & Cramming.

Winner of 2019 Digital Edge
50 Award for Data Analytics!

Supplements

ALEKS®

This text is available with the adaptive online learning platform ALEKS. Rooted in 20 years of research and analytics, ALEKS identifies what students know, what they don't know, and what they are ready to learn, then personalizes a learning path tailored to each student. This personalization keeps students focused on what they need to learn and prepares them to make real-world connections. ALEKS also delivers textbook-aligned exercises, videos, and the many author-created digital supplements that accompany this text.

create®

With **McGraw Hill Create™**, you can easily rearrange chapters, combine material from other content sources, and quickly upload content you have written like your course syllabus or teaching notes. Find the content you need in Create by searching through thousands of leading McGraw Hill textbooks. Arrange your book to fit your teaching style. Create even allows you to personalize your book's appearance by selecting the cover and adding your name, school, and course information. Assemble a Create book, and you'll receive a complimentary print review copy in 3–5 business days or a complimentary electronic review copy (eComp) via email in minutes. Go to www.mcgrawhillcreate.com today and experience how McGraw Hill Create™ empowers you to teach *your* students *your* way.

Videos

Author-produced lecture videos introduce concepts, definitions, formulas, and problem-solving procedures to help students better comprehend the topic at hand. Exercise videos illustrate the authors working through selected exercises, following the solution methodology employed in the text. These videos are closed-captioned for the hearing-impaired and meet the Americans with Disabilities Act Standards for Accessible Design.

Computerized Test Bank Online (instructors only)

This computerized test bank, available online to adopting instructors, utilizes TestGen® cross-platform test generation software to quickly and easily create customized exams. Using hundreds of test items taken directly from the text, TestGen allows rapid test creation and flexibility for instructors to create their own questions from scratch with the ability to randomize number values. Powerful search and sort functions help quickly locate questions and arrange them in any order, and built-in mathematical templates let instructors insert stylized text, symbols, graphics, and equations directly into questions without need for a separate equation editor.

TI-84 Plus Graphing Calculator Manual

This friendly, author-influenced manual teaches students to learn about statistics and solve problems by using this calculator while following each text chapter.

Excel Manual

This workbook, specially designed to accompany the text by the authors, provides additional practice in applying the chapter concepts while using Excel.

MINITAB 17 Manual

With guidance from the authors, this manual includes material from the book to provide seamless use from one to the other, providing additional practice in applying the chapter concepts while using the MINITAB program.

Guided Student Notes

Guided notes provide instructors with the framework of day-by-day class activities for each section in the book. Each lecture guide can help instructors make more efficient use of class time and can help keep students focused on active learning. Students who use the lecture guides have the framework of well-organized notes that can be completed with the instructor in class.

Data Sets

Data sets from selected exercises have been pre-populated into MINITAB, TI-Graph Link, Excel, SPSS, and comma-delimited ASCII formats for student and instructor use. These files are available on the text's website.

Print Supplements

Annotated Instructor's Edition (instructors only)

The Annotated Instructor's Edition contains answers to all exercises. The answers to most questions are printed in blue next to each problem. Answers not appearing on the page can be found in the Answer Appendix at the end of the book.

Statistics Corequisite Workbook

This workbook, co-written by author Barry Monk, is designed to provide corequisite remediation of the necessary skills for an introductory statistics course. The included topics are largely independent of one another and may be used in any order that works best for the instructor. The workbook is available online or can be ordered in print format through Create.

Index of Applications

Agricultural/gardening/farming applications. *See also* Forestry

applications
absorption rate of pesticides into skin, 675
acid levels of soil, 693
bean plants, 576
chicken weights, 332
fertilizer, 580
fertilizer effect on maple sap production, 675, 688
fertilizer effect on orange trees, 437, 514, 694
fertilizer effect on tomato yield, 26
great pumpkins, 187–188, 200
herbicides and phosphate concentration of bean plants, 535
pesticides and fruit yields, 690
phosphorus in soil, 677
seed germination rate, 355, 532
temperature and water evaporation, 628–629, 635
wheat yields, 703

Archaeology applications

mummy's curse and life spans, 549

Automotive/motor vehicle applications

accidents at intersections, 531
accidents per year, 117, 296
air pollution caused by motor vehicles, 79–80, 523, 535, 568, 558–559
battery lifetimes, 368
BMW prices, 68, 79
brake wear and mileage, 522
car repairs, 233–234, 247, 355
car speeds and stopping distance, 202–203
car speeds and street noise level, 176, 628, 634
car speeds on highways, 333, 494
coating for gears, 580
delivery truck load weights, 369
don't drink and drive, 11, 114
drag-racing parachutes, 259
emissions at sea level and high altitude, 156–157, 535, 568
emissions testing, 288, 647–648
fuel efficiency, 32, 133, 524
gas mileage, 33, 96, 133, 206, 341, 402, 707–708
gas prices, 112
hybrid cars, 92
license plate choices, 255
new car choice probabilities, 247
new car sales, 49–50
new car satisfaction, 349
new truck sales, 50
parking on campus, 11
phones and driving, 33
pickup truck ownership, 247
pillars giving head protection in cars, 677
risky drivers, 224

tire lifetimes, 332, 498
tires and fuel economy, 33, 524
tires and number of miles traveled, 558, 694–695
tires with low air pressure, 275
tire tread depth, 716–717
truck pollution, 523, 558–559
truck weight and gas mileage, 206, 654
used car ages, 404
years between accidents, 516, 550
yellow light and driver behavior, 569

Aviation applications

airline ticketing policy, 355
flight delays, 288

Behavioral study applications. *See also* Psychological applications

dog weights, 438
don't drink and drive, 11, 114
nicotine patch to quit smoking, 486
weight loss during counseling, 474

Beverage applications

breweries in selected states, 112, 134
caffeine in coffee, 437–438
calories in milkshakes, 384
carbohydrates in espresso beverages, 155
coffee prices, 708
daily coffee consumption, 347
don't drink and drive, 11, 114
energy drinks, 383–384, 515
moisture content of coffee beans, 498
strength of aluminum cans, 370
volume of beverage in can, 333, 474, 491, 717
volume of beverage in large-sized sodas, 676

Biology/life science

applications. *See also* Genetics/gender applications
age of babies beginning to talk, 401
bird brain weight *versus* body weight, 189
blood typing system for humans, 46, 259, 288
butterfly wingspan *versus* lifespan, 177, 188, 627–628, 634
Down Syndrome births, 296
forearm length and height, 206
gestational age and baby weights, 207
height and age, 455
heights of boys and men, 116, 138, 333, 524, 559
heights of college students, 66, 117
heights of fathers and sons, 627, 634
heights of women, 110, 116, 138, 333
random sampling of animal groups, 11
rats running mazes, 66, 475
shrimp habitat and water pollution, 535
weights/lengths of fish, 154, 331–332, 365, 437
weights of animals, 457, 476

weights of girls and women, 115
weights of newborn babies, 137, 207, 421–422, 549, 716
weights of older babies, 289, 331, 355, 383, 401, 474, 491, 515

Business applications

advertisement views, 498
advertising expenditures, 113–114, 161–162
age discrimination, 605
bond prices, 136
cable subscriptions, 87
CEO salaries, 402
college graduates working at home, 414
company revenue, 111
confidence in banks, 486
corporate profits, 160, 162
credit card balances, 457
credit card payments, 425
credit scores, 203, 474, 651–652
day and night shifts, 255
days per year spent traveling, 438
Dow Jones Industrial Average, 87, 136
economy in the future, 18, 416, 533, 597
extending banking hours, 30
financial literacy, 713
finding job after job loss, 299
flextime in company to reduce sick days, 582
free desserts to increase business, 475
gas prices, 112
government employee percentages, 348
hourly wages and/or years employed, 70, 116, 177–178, 385
inflation rate and unemployment rate, 210–211
interest in economics, 91, 487
job changes, 416
job satisfaction, 224, 501
job security, 48
life expectancy, 33
life insurance, 261–262, 277
management jobs and gender, 247
marketing firm survey, 19, 498
mean and median salaries, 117
mean federal income tax, 341
mean state income tax, 368
multiple jobs held, 348
on-site day care, 12
opinions of service at a store, 11, 12
personal incomes, 115, 116, 157
phone company market shares, 92
prime interest rate, 189
random-digit dialing as sampling method, 30
restaurant customers on Mondays *versus* Tuesdays, 716
retail spending, 11–12, 79
return on investment, 136
sales commissions, 583
sales tax increase, 487
sales tax on internet purchases, 487

satisfaction with financial situation, 532, 596
 saving by U.S. residents, 88
 science careers, 494
 spreadsheet testing, 583, 676–677
 start-up probabilities, 259, 277
 stock market averages and first digits of the number, 301
 stock market crash, 87
 stock prices, 87, 113, 135, 161, 383, 488, 535
 streaming video fees, 487
 stress at work, 289, 355
 tax return refunds, 12
 tax returns and first digits of the number, 302
 tax returns for which no tax paid, 341
 unemployment rate in U.S., 80, 200
 U.S. imports and exports by month, 201
 weekly earnings, 348
 women in service occupations, 247
 words typed per minute, 384
 workforce increases during economic downturn, 416

Chemicals/chemistry applications

acid levels of soil, 693
 adhesive bond strength, 689
 ammonium in water wells, 333
 bacteria in pond water, 295–296
 benzene in wastewater, 514, 549, 583
 calories in fat, 629
 carbon monoxide concentration, 404
 chemicals in well water, 693–694
 cleaning solutions, 689
 gypsum and acid level, 693
 gypsum and electrical conductivity, 693, 694
 lead in water, 415, 456
 mercury in lakes, 494
 mineral content of kale, 403
 mineral content of spinach, 402, 422
 ozone concentration, 189
 paint drying time, 655
 paint lifetime, 650
 phosphorus in soil, 677
 soap lather, 688–689
 soap weights, 162
 suspended particles, 299
 temperature, concentration, and time in chemical reactions, 651
 temperature and water evaporation, 628–629, 635

Computer applications. *See*

Electronics/computer applications

Construction/home improvement/home purchases and sales applications

air conditioner costs, 716
 apartment rents, 161, 341, 502, 703, 713
 asphalt-rubber concrete beam strength, 689
 breaking strength of wood boards, 676
 building new parking structure, 427
 construction site water contamination, 415

electricity bills/prices, 138, 332
 expansion of concrete over time, 628, 635
 fireplaces and garages, 235
 household income and energy consumed, 206, 655
 house prices, 81, 113, 135, 456, 474
 house size and energy expenditures, 201
 house size and selling price, 202
 house sizes, 477, 494
 mortgage payments/rates, 177, 188, 402, 422
 radon levels, 203, 332
 recovering from heart attacks in smaller houses, 26
 sales price *versus* rental price of homes, 202
 smoke detectors in homes, 289
 vacant apartment rates, 80–81

Crime

graffiti by borough, 235
 illegal drug use in high school, 30
 murder rates in cities, 67–68
 police department effectiveness, 30
 police numbers and crimes committed, 177
 taxicabs and crime rates, 26
 violent crime categories and rates, 596

Dental applications

fluoride and tooth decay, 33

Earth science applications

altitude and pollution from cars, 156–157, 535, 568
 arctic ice sheet, 83
 floodwater drainage time, 676
 geyser eruption durations, 68, 651
 global warming, 18
 humidity and ozone levels, 629, 635
 hurricanes, 568, 713–714
 ice on lakes, 656–657
 silver ore in rock samples, 70
 wind speeds and electric power generated, 659

Education/school applications

absences from school, 610
 adults with degrees, 89, 115
 advanced placement tests, 298
 age and education, 115, 177
 age at high school graduation, 177
 ages of college students, 404, 424, 457
 air pollution in Chinese schools, 26
 annual incomes of college graduates, 384
 arithmetic teaching method, 477
 attitudes toward school, 384
 cafeteria food rating, 299
 choosing books to study, 255
 college enrollments, 81, 288, 355
 college freshmen majoring in sciences, 348
 college graduates working at home, 414
 college tuition, 425, 474, 535
 computers in the classroom, 531
 confidence in educational institutions, 224
 course selection, 259
 distance learning effectiveness, 515
 educational issues and visits to science museums, 605

education levels, 49, 401, 609
 energy drinks consumed by college students, 515
 exam scores, 69, 139, 156, 333
 exam score *versus* hours spent studying, 188–189
 favorite subjects, 688
 female business majors, 259
 final exam scores, 116, 156, 189, 333
 final grade probabilities, 234, 259
 final grades, 116
 gender bias in graduate school admissions, 610–612
 gender differences in attitudes and behaviors, 580
 girls enrolled in elementary school, 369
 grade distributions, 595–596
 grade point averages, 69, 318–319, 384, 456, 649–650
 graduate salaries *versus* years of experience, 189
 heights of college students, 66, 117
 high school dropouts, 247
 high school freshmen graduating with their class, 347–348
 homework not completed by college freshmen, 92
 homework score, 116
 homework submitted electronically, 33
 hours of sleep, 403, 428
 hours spent studying or reading, 188–189, 333, 404
 illegal drug use in high school, 30
 IQ test scores, 421, 438, 491, 515, 549, 576
 male *versus* female college students, 81
 math skills testing, 428, 455, 713
 multiple choice questions, 30, 277, 288
 number of siblings, 69
 online learning courses, 401
 ordering of supplies, 32
 parking on campus, 11
 phonics, 401
 quiz scores, 93
 reading skills, 11, 299, 365, 415, 569

Introduction

How does air pollution affect your health? Over the past several decades, scientists have become increasingly convinced that air pollution is a serious health hazard. The World Health Organization has estimated that air pollution causes 2.4 million deaths each year. The health effects of air pollution have been investigated by measuring air pollution levels and rates of disease, then using statistical methods to determine whether higher levels of pollution lead to higher rates of disease.

Many air pollution studies have been conducted in the United States. For example, the town of Libby, Montana, was the focus of a recent study of the effect of particulate matter—air pollution that consists of microscopic particles—on the respiratory health of children. As part of this study, parents were asked to fill out a questionnaire about their children's respiratory symptoms. It turned out that children exposed to higher levels of particulate pollution were more likely to exhibit symptoms of wheezing, as shown in the following table.

Level of Exposure	Percentage with Symptoms
High	8.89%
Low	4.56%

The rate of symptoms was almost twice as high among those exposed to higher levels of pollution. At first, it might seem easy to conclude that higher levels of pollution cause

symptoms of wheezing. However, drawing accurate conclusions from information like this is rarely that simple. The case study at the end of this chapter will present more complete information and will show that additional factors must be considered.

Section

Sampling

1.1

Objectives

1. Describe the investigative process of statistics
2. Construct a simple random sample
3. Determine when samples of convenience are acceptable
4. Describe stratified sampling, cluster sampling, systematic sampling, and voluntary response sampling
5. Distinguish between statistics and parameters

Objective 1 Describe the investigative process of statistics

In the months leading up to an election, polls often tell us the percentages of voters that prefer each of the candidates. How do pollsters obtain this information? The ideal poll would be one in which every registered voter were asked his or her opinion. Of course, it is impossible to conduct such an ideal poll, because it is impossible to contact every voter. Instead, pollsters contact a relatively small number of voters, usually no more than a couple of thousand, and use the information from these voters to predict the preferences of the entire group of voters.

The process of polling requires two major steps. First, the voters to be polled must be selected and interviewed. In this way the pollsters collect information. In the second step, the pollsters analyze the information to make predictions about the upcoming election. Both the collection and the analysis of the information must be done properly for the results to be reliable. The field of statistics provides appropriate methods for the collection, description, and analysis of information.

DEFINITION

Statistics is the study of procedures for collecting, describing, and drawing conclusions from information.

Polling follows a process that is typical in statistics. We formulate questions (Which candidate is most likely to win?), then collect and analyze data to address the questions. In general, statistics is an investigative process that involves the following four steps:

- Formulate questions.
- Collect data needed to answer the questions.
- Describe the data.
- Draw conclusions, using appropriate methods.

In this section, we will focus on the second step in the process—the collection of data. The polling problem is typical of a data collection problem. We want some information about a large group of individuals, but we are able to collect information on only a small part of that group. In statistical terminology, the large group is called a *population*, and the part of the group on which we collect information is called a *sample*.

EXPLAIN IT AGAIN

Why do we draw samples?

It's usually impossible to examine every member of a large population. So we select a group of a manageable size to examine. This group is called a sample.

DEFINITION

- A **population** is the entire collection of individuals about which information is sought.
- A **sample** is a subset of a population, containing the individuals that are actually observed.

Ideally, we would like our sample to represent the population as closely as possible. For example, in a political poll, we would like the proportions of voters preferring each of the candidates to be the same in the sample as in the population. Unfortunately, there are no methods that can guarantee that a sample will represent the population well. The best we can do is to use a method that makes it very likely that the sample will be similar to the population. The best sampling methods all involve some kind of random selection. The most basic, and in many cases the best, sampling method is the method of **simple random sampling**.

Objective 2 Construct a simple random sample

Simple Random Sampling

To understand the nature of a simple random sample, think of a lottery. Imagine that 10,000 lottery tickets have been sold, and that 5 winners are to be chosen. What is the fairest way to choose the winners? The fairest way is to put the 10,000 tickets in a drum, mix them thoroughly, then reach in and draw 5 tickets out one by one. These 5 winning tickets are a simple random sample from the population of 10,000 lottery tickets. Each ticket is equally likely to be one of the 5 tickets drawn. More importantly, each collection of 5 tickets that can be formed from the 10,000 is equally likely to comprise the group of 5 that is drawn.

DEFINITION

A **simple random sample** of size n is a sample chosen by a method in which each collection of n population items is equally likely to make up the sample, just as in a lottery.

Since a simple random sample is analogous to a lottery, it can often be drawn by the same method now used in many lotteries: with a computer random number generator. Suppose there are N items in the population. We number the items 1 through N . Then we generate a list of random integers between 1 and N and choose the corresponding population items to comprise the simple random sample.

Example 1.1

Choosing a simple random sample

There are 300 employees in a certain company. The Human Resources department wants to draw a simple random sample of 20 employees to fill out a questionnaire about their attitudes toward their jobs. Describe how technology can be used to draw this sample.

Solution

Step 1: Make a list of all 300 employees, and number them from 1 to 300.

Step 2: Use a random number generator on a computer or a calculator to generate 20 random numbers between 1 and 300. The employees who correspond to these numbers comprise the sample.

Example 1.2

Determining whether a sample is a simple random sample

A physical education professor wants to study the physical fitness levels of students at her university. There are 20,000 students enrolled at the university, and she wants to draw a sample of size 100 to take a physical fitness test. She obtains a list of all 20,000 students, numbered from 1 to 20,000. She uses a computer random number generator to generate 100 random integers between 1 and 20,000, then invites the 100 students corresponding to those numbers to participate in the study. Is this a simple random sample?

Solution

Yes, this is a simple random sample because any group of 100 students would have been equally likely to have been chosen.

Example 1.3**Determining whether a sample is a simple random sample**

The professor in Example 1.2 now wants to draw a sample of 50 students to fill out a questionnaire about which sports they play. The professor's 10:00 A.M. class has 50 students. She uses the first 20 minutes of class to have the students fill out the questionnaire. Is this a simple random sample?

Solution

No. A simple random sample is like a lottery, in which each student in the population has an equal chance to be part of the sample. In this case, only the students in a particular class had a chance to be in the sample.

Example 1.4**In a simple random sample, all samples are equally likely**

To play the Colorado Lottery Lotto game, you must select six numbers from 1 to 42. Then lottery officials draw a simple random sample of six numbers from 1 to 42. If your six numbers match the ones in the simple random sample, you win the jackpot. Sally plays the lottery and chooses the numbers 1, 2, 3, 4, 5, 6. Her friend George says that this isn't a good choice, since it is very unlikely that a random sample will turn up the first six numbers. Is he right?

Solution

No. It is true that the combination 1, 2, 3, 4, 5, 6 is unlikely, but every other combination is equally unlikely. In a simple random sample of size 6, every collection of six numbers is equally likely (or equally unlikely) to come up. So Sally has the same chance as anyone to win the jackpot.

Example 1.5**Using technology to draw a simple random sample**

Use technology to draw a simple random sample of five employees from the following list.

1. Dan Aaron	11. Johnny Gaines	21. Jorge Ibarra	31. Edward Shingleton
2. Annie Bienh	12. Carlos Garcia	22. Maurice Jones	32. Michael Speciale
3. Oscar Bolivar	13. Julio Gonzalez	23. Jared Kerns	33. Andrew Steele
4. Dominique Bonnaud	14. Jacqueline Gordon	24. Kevin King	34. Neil Swain
5. Paul Campbell	15. James Graves	25. Frank Lipka	35. Sherry Thomas
6. Jeffrey Carnahan	16. Ronald Harrison	26. Carl Luther	36. Shequiea Thompson
7. Joel Chae	17. Andrew Huang	27. Laverne Mitchell	37. Barbara Tilford
8. Dustin Chen	18. Anthony Hunter	28. Zachary Quesada	38. Jermaine Tryon
9. Steven Coleman	19. Jonathan Jackson	29. Donnell Romaine	39. Lizbet Valdez
10. Richard Davis	20. Bruce Johnson	30. Gary Sanders	40. Katelyn Yu

Solution

We will use the TI-84 Plus graphing calculator. The step-by-step procedure is presented in the Using Technology section on page 9. We begin by choosing a **seed**, which is a number that the calculator uses to get the random number generator started. Display (a) shows the seed being set to 21. (The seed can be chosen in almost any way; this number was chosen by looking at the seconds display on a digital watch.) Display (b) presents the five numbers in the sample.

21 → rand

(a)

randIntNoRep(1, 40, 5)
..... {27 39 30 35 17}

(b)

The simple random sample consists of the employees with numbers 27, 39, 30, 35, and 17. These are Laverne Mitchell, Lizbet Valdez, Gary Sanders, Sherry Thomas, and Andrew Huang.

CAUTION

If you use a different type of calculator, a different statistical package, or a different seed, you will get a different random sample. This is perfectly all right. So long as the sample is drawn by using a correct procedure, it is a valid random sample.

Check Your Understanding

1. A pollster wants to estimate the proportion of voters in a certain town who are Democrats. He goes to a large shopping mall and approaches people to ask whether they are Democrats. Is this a simple random sample? Explain.
2. A telephone company wants to estimate the proportion of customers who are satisfied with their service. They use a computer to generate a list of random phone numbers and call those people to ask them whether they are satisfied. Is this a simple random sample? Explain.

Answers are on page 12.

Objective 3 Determine when samples of convenience are acceptable

Samples of Convenience

In some cases, it is difficult or impossible to draw a sample in a truly random way. In these cases, the best one can do is to sample items by some convenient method. A sample obtained in such a way is called a *sample of convenience*.

DEFINITION

A **sample of convenience** is a sample that is not drawn by a well-defined random method.

Example 1.6

Creatas Images/Jupiterimages

Drawing a sample of convenience

A construction engineer has just received a shipment of 1000 concrete blocks, each weighing approximately 50 pounds. The blocks have been delivered in a large pile. The engineer wishes to investigate the crushing strength of the blocks by measuring the strengths in a sample of 10 blocks. Explain why it might be difficult to draw a simple random sample of blocks. Describe how the engineer might draw a sample of convenience.

Solution

To draw a simple random sample would require removing blocks from the center and bottom of the pile, which might be quite difficult. One way to draw a sample of convenience would be to simply take 10 blocks off the top of the pile.

Problems with samples of convenience

The big problem with samples of convenience is that they may differ systematically in some way from the population. For this reason, samples of convenience should not be used, except in some situations where it is not feasible to draw a random sample. When it is necessary to

CAUTION

Don't use a sample of convenience when it is possible to draw a simple random sample.

draw a sample of convenience, it is important to think carefully about all the ways in which the sample might differ systematically from the population. If it is reasonable to believe that no important systematic difference exists, then it may be acceptable to treat the sample of convenience as if it were a simple random sample. With regard to the concrete blocks, if the engineer is confident that the blocks on the top of the pile do not differ systematically in any important way from the rest, then he can treat the sample of convenience as a simple random sample. If, however, it is possible that blocks in different parts of the pile may have been made from different batches of mix, or may have different curing times or temperatures, a sample of convenience could give misleading results.

SUMMARY

- A sample of convenience may be acceptable when it is reasonable to believe that there is no systematic difference between the sample and the population.
- A sample of convenience is not acceptable when it is possible that there is a systematic difference between the sample and the population.

Objective 4 Describe stratified sampling, cluster sampling, systematic sampling, and voluntary response sampling

Some Other Sampling Methods**Stratified sampling**

In **stratified sampling**, the population is divided into groups, called **strata**, where the members of each stratum are similar in some way. Then a simple random sample is drawn from each stratum. Stratified sampling is useful when the strata differ from one another, but the individuals within a stratum tend to be alike.

Example 1.7**Drawing a stratified sample**

A company has 1000 employees, of whom 800 are full-time and 200 are part-time. The company wants to survey 50 employees about their opinions regarding benefits. Attitudes toward benefits may differ considerably between full-time and part-time employees. Why might it be a good idea to draw a stratified sample? Describe how one might be drawn.

Solution

If a simple random sample is drawn from the entire population of 1000 employees, it is possible that the sample will contain only a few part-time employees, and their attitudes will not be well represented. For this reason, it might be advantageous to draw a stratified sample. To draw a stratified sample, one would use two strata. One stratum would consist of the full-time employees, and the other would consist of the part-time employees. A simple random sample would be drawn from the full-time employees, and another simple random sample would be drawn from the part-time employees. This method guarantees that both full-time and part-time employees will be well represented.

EXPLAIN IT AGAIN

Example of a cluster sample: Imagine drawing a simple random sample of households and interviewing every member of each household. This would be a cluster sample, with the households as the clusters.

Cluster sampling

In **cluster sampling**, items are drawn from the population in groups, or clusters. Cluster sampling is useful when the population is too large and spread out for simple random sampling to be feasible. Cluster sampling is used extensively by U.S. government agencies in sampling the U.S. population to measure sociological factors such as income and unemployment.

Example 1.8**Drawing a cluster sample**

To estimate the unemployment rate in a county, a government agency draws a simple random sample of households in the county. Someone visits each household and asks how

many adults live in the household and how many of them are unemployed. What are the clusters? Why is this a cluster sample?

Solution

The clusters are the groups of adults in each of the households in the county. This is a cluster sample because a simple random sample of clusters is selected, and every individual in each selected cluster is part of the sample.

EXPLAIN IT AGAIN

The difference between cluster sampling and stratified sampling: In both cluster sampling and stratified sampling, the population is divided into groups. In stratified sampling, a simple random sample is chosen from each group. In cluster sampling, a random sample of groups is chosen, and every member of the chosen groups is sampled.

Systematic sampling

Imagine walking alongside a line of people and choosing every third one. That would produce a **systematic sample**. In a systematic sample, the population items are ordered. It is decided how frequently to sample items; for example, one could sample every third item, or every fifth item, or every hundredth item. Let k represent the sampling frequency. To begin the sampling, choose a starting place at random. Select the item in the starting place, along with every k th item after that.

Systematic sampling is sometimes used to sample products as they come off an assembly line, in order to check that they meet quality standards.

Example 1.9

Describe a systematic sample

Automobiles are coming off an assembly line. It is decided to draw a systematic sample for a detailed check of the steering system. The starting point will be the third car, then every fifth car after that will be sampled. Which cars will be sampled?

Solution

We start with the third car, then count by fives to determine which cars will be sampled. The sample will consist of cars numbered 3, 8, 13, 18, and so on.

Digital Vision/Punchstock

Voluntary response sampling

Voluntary response samples are often used by the media to try to engage the audience. For example, a news commentator will invite people to tweet an opinion, or a radio announcer will invite people to call the station to say what they think. How reliable are voluntary response samples? To put it simply, *voluntary response samples are never reliable*. People who go to the trouble to volunteer an opinion tend to have stronger opinions than is typical of the population. In addition, people with negative opinions are often more likely to volunteer their responses than those with positive opinions.

Figures 1.1–1.4 illustrate several valid methods of sampling.

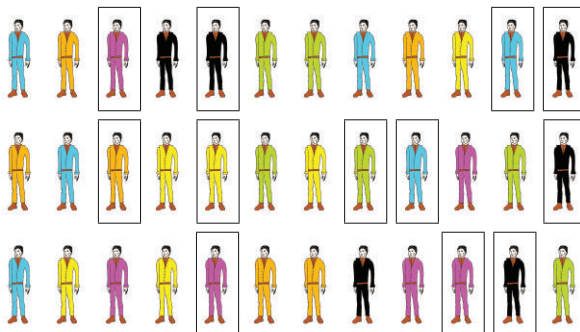

Figure 1.1 Simple random sampling

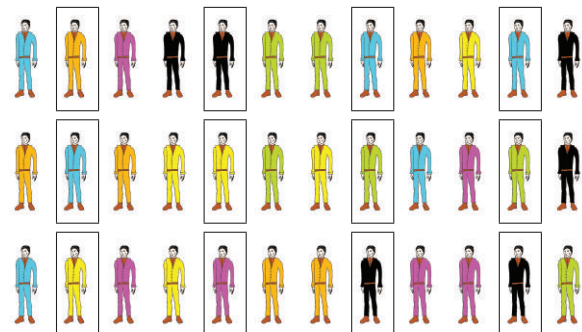

Figure 1.2 Systematic sampling

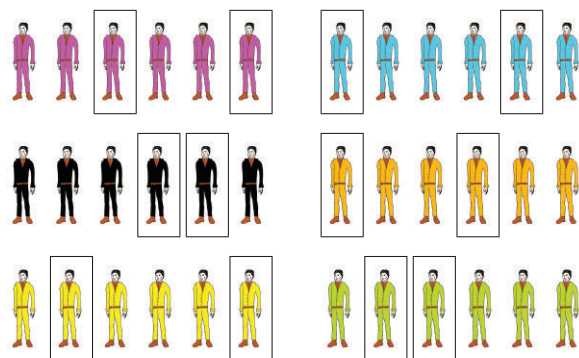

Figure 1.3 Stratified sampling

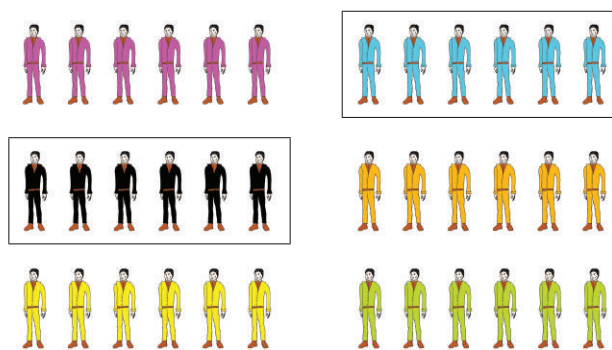

Figure 1.4 Cluster sampling

Check Your Understanding

3. A radio talk show host invites listeners to send an email to express their opinions on an upcoming election. More than 10,000 emails are received. What kind of sample is this?
4. Every 10 years, the U.S. Census Bureau attempts to count every person living in the United States. To check the accuracy of their count in a certain city, they draw a sample of census districts (roughly equivalent to a city block) and recount everyone in the sampled districts. What kind of sample is formed by the people who are recounted?
5. A public health researcher is designing a study of the effect of diet on heart disease. The researcher knows that the diets of men and women tend to differ and that men are more susceptible to heart disease. To be sure that both men and women are well represented, the study comprises a simple random sample of 100 men and another simple random sample of 100 women. What kind of sample do these 200 people represent?
6. A college basketball team held a promotion at one of its games in which every twentieth person who entered the arena won a free basketball. What kind of sample do the winners represent?

Answers are on page 12.

Simple random sampling is the most basic method

Simple random sampling is not the only valid method of random sampling. But it is the most basic, and we will focus most of our attention on this method. From now on, unless otherwise stated, the terms *sample* and *random sample* will be taken to mean *simple random sample*.

Objective 5 Distinguish between statistics and parameters

Statistics and Parameters

We often use numbers to describe, or summarize, a sample or a population. For example, suppose that a pollster draws a sample of 500 likely voters in an upcoming election, and 68% of them say that the state of the economy is the most important issue for them. The quantity “68%” describes the sample. A number that describes a sample is called a *statistic*.

DEFINITION

A **statistic** is a number that describes a sample.

EXPLAIN IT AGAIN

Statistic and parameter: An easy way to remember these terms is that “statistic” and “sample” both begin with “s,” and “parameter” and “population” both begin with “p.”

Now imagine that the election takes place and that one of the items on the ballot is a proposition to raise the sales tax to pay for the development of a new park downtown. Let’s say that 53% of the voters vote in favor of the proposition. The quantity “53%” describes the population of voters who voted in the election. A number that describes a population is called a *parameter*.

DEFINITION

A **parameter** is a number that describes a population.

Example 1.10**Distinguishing between a statistic and a parameter**

Which of the following is a statistic and which is a parameter?

- 57% of the teachers at Central High School are female.
- In a sample of 100 surgery patients who were given a new pain reliever, 78% of them reported significant pain relief.

Solution

- The number 57% is a parameter, because it describes the entire population of teachers in the school.
- The number 78% is a statistic, because it describes a sample.

Using Technology

We use Example 1.5 to illustrate the technology steps.

TI-84 PLUS**Drawing a simple random sample**

- Enter any nonzero number on the HOME screen as the seed.
- Press **STO >**.
- Press **MATH**, select **PRB**, then **1: rand**, and then press **ENTER**. This enters the seed into the calculator memory. See Figure A, which uses the number 21 as the seed.
- Press **MATH**, select **PRB**, then **5: randIntNoRep**. Then enter **1, N, n**, where **N** is the population size and **n** is the desired sample size. In Example 1.5, we use **N = 40** and **n = 5** (Figure B).
- Press **ENTER**. The five values in the random sample for Example 1.5 are **27, 39, 30, 35, 17** (Figure C).

Figure A

Figure B

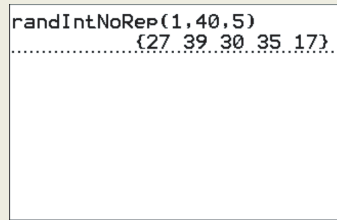

Figure C

EXCEL

Drawing a simple random sample

- Step 1.** In **Column A**, enter the values **1** through the population size **N**. For Example 1.5, **N** = 40.
- Step 2.** In **Column B**, next to each value in **Column A**, enter the command **=RAND()**. This results (Figure D) in a randomly generated number between 0 and 1 in each cell in **Column B**.
- Step 3.** Select all values in **Columns A** and **B** and then click on the **Data** menu and select **Sort**.
- Step 4.** In the **Sort by** field, enter **Column B** and select **Smallest to Largest** in the **Order** field. Press **OK**. **Column A** now contains the random sample. Our random sample begins with **17, 12, 28, 20, 6, ...** (Figure E).

	A	B	C
1	1	0.09259	
2	2	0.93582	
3	3	0.01524

MINITAB

Drawing a simple random sample

- Step 1.** Click **Calc**, then **Random Data**, then **Integer...**
- Step 2.** In the **Number of rows of data to generate** field, enter twice the desired sample size. For example, if the desired sample size is 10, enter 20. The reason for this is that some sample items may be repeated, and these will need to be deleted.
- Step 3.** In the **Store in column(s)** field, enter **C1**.
- Step 4.** Enter **1** for the **Minimum value** and the population size **N** for the **Maximum value**. We use **Maximum value** = 40 for Example 1.5. Click **OK**.
- Step 5.** **Column C1** of the worksheet will contain a list of randomly selected numbers between **1** and **N**. If any number appears more than once in **Column C1**, delete the replicates so that the number appears only once. For Example 1.5, our random sample begins with **16, 14, 30, 28, 17, ...** (Figure F).

Section

1.1

Exercises

Exercises 1–6 are the Check Your Understanding exercises located within the section.

Understanding the Concepts

In Exercises 7–12, fill in each blank with the appropriate word or phrase.

- 7. The entire collection of individuals about which information is sought is called a _____.
- 8. A _____ is a subset of a population.
- 9. A _____ is a type of sample that is analogous to a lottery.
- 10. A sample that is not drawn by a well-defined random method is called a _____.
- 11. A _____ sample is one in which the population is divided into groups and a random sample of groups is drawn.
- 12. A _____ sample is one in which the population is divided into groups and a random sample is drawn from each group.

In Exercises 13–16, determine whether the statement is true or false. If the statement is false, rewrite it as a true statement.

13. A sample of convenience is never acceptable.
14. In a cluster sample, the population is divided into groups, and a random sample from each group is drawn.
15. Both stratified sampling and cluster sampling divide the population into groups.
16. One reason that voluntary response sampling is unreliable is that people with stronger views tend to express them more readily.

Practicing the Skills

In Exercises 17–22, determine whether the number described is a statistic or a parameter.

17. In a recent poll, 57% of the respondents supported a school bond issue.
18. The average age of the employees in a certain company is 35 years.
19. Of the students enrolled in a certain college, 80% are full-time.
20. In a survey of 500 high school students, 60% of them said that they intended to go to college.
21. The U.S. Census reports that 95% of California residents live in urban areas.
22. In a survey of parents with children under the age of six, 90% said that their child had been seen by a pediatrician within the past year.

Exercises 23–26 refer to the population of animals in the following table. The population is divided into four groups: mammals, birds, reptiles, and fish.

Mammals		Birds	
1. Aardvark	6. Lion	11. Flamingo	16. Hawk
2. Buffalo	7. Zebra	12. Swan	17. Owl
3. Elephant	8. Pig	13. Sparrow	18. Chicken
4. Squirrel	9. Dog	14. Parrot	19. Duck
5. Rabbit	10. Horse	15. Pelican	20. Turkey
Reptiles		Fish	
21. Gecko	26. Python	31. Catfish	36. Shark
22. Iguana	27. Turtle	32. Tuna	37. Trout
23. Chameleon	28. Tortoise	33. Cod	38. Perch
24. Rattlesnake	29. Alligator	34. Salmon	39. Guppy
25. Boa constrictor	30. Crocodile	35. Goldfish	40. Minnow

23. **Simple random sample:** Draw a simple random sample of eight animals from the list of 40 animals in the table.
24. **Another sample:** Draw a sample of eight animals by drawing a simple random sample of two animals from each group. What kind of sample is this?
25. **Another sample:** Draw a simple random sample of two groups of animals from the four groups, and construct a sample of 20 animals by including all the animals in the sampled groups. What kind of sample is this?
26. **Another sample:** Choose a random number between 1 and 5. Include the animal with that number in your sample, along with every fifth animal thereafter, to construct a sample of eight animals. What kind of sample is this?

In Exercises 27–42, identify the kind of sample that is described.

27. **Parking on campus:** A college faculty consists of 400 men and 250 women. The college administration wants to draw a sample of 65 faculty members to ask their opinion about a new parking fee. They draw a simple random sample of 40 men and another simple random sample of 25 women.
28. **Cruising the mall:** A pollster walks around a busy shopping mall and approaches people passing by to ask them how often they shop at the mall.
29. **What's on TV?** A pollster obtains a list of all the residential addresses in a certain town and uses a computer random number generator to choose 150 of them. The pollster visits each of the 150 households and interviews all the adults in each household about their television viewing habits.
30. **Don't drink and drive:** Police at a sobriety checkpoint pull over every fifth car to determine whether the driver is sober.
31. **Tell us your opinion:** A television newscaster invites viewers to tweet their opinions on a proposed bill on immigration policy. More than 50,000 people express their opinions in this way.
32. **Reading program:** The superintendent of a large school district wants to test the effectiveness of a new program designed to improve reading skills among elementary school children. There are 30 elementary schools in the district. The superintendent chooses a simple random sample of five schools and institutes the new reading program in those schools. A total of 4700 children attend these five schools.

Somos Images/Alamy

33. **Customer survey:** All the customers who entered a store on a particular day were given a survey to fill out concerning their opinions of the service at the store.
34. **Raffle:** Five hundred people attend a charity event, and each buys a raffle ticket. The 500 ticket stubs are put in a drum and thoroughly mixed, and 10 of them are drawn. The 10 people whose tickets are drawn win a prize.
35. **Hospital survey:** The director of a hospital pharmacy chooses at random 100 people age 60 or older from each of three surrounding counties to ask their opinions of a new prescription drug program.
36. **Bus schedule:** Officials at a metropolitan transit authority want to get input from people who use a certain bus route about a possible change in the schedule. They randomly select 5 buses during a certain week and poll all riders on those buses about the change.
37. **How much did you spend?** A retailer samples 25 receipts from the past week by numbering all the receipts, generating

- 25 random numbers, and sampling the receipts that correspond to these numbers.
- 38. Phone features:** A phone company wants to draw a sample of 600 customers to gather opinions about potential new features on upcoming phone models. The company draws a random sample of 200 from customers with iPhones, a random sample of 100 from customers with LG phones, a random sample of 100 from customers with Samsung phones, and a random sample of 200 from customers with other phones.
- 39. Computer network:** Every third day, a computer network administrator analyzes the company’s network logs to check for signs of computer viruses.
- 40. Apps:** An app produces a message requesting customers to click on a link to rate the app.
- 41. Survey:** A nutritionist randomly chooses 100 people who have been using a certain weight loss program and asks them how much weight they have lost.
- 42. Good service:** Receipts at a department store indicate a website where customers can take a survey indicating their level of satisfaction with the service they received.

Working with the Concepts

- 43. You’re giving me a headache:** A pharmaceutical company wants to test a new drug that is designed to provide superior relief from headaches. They want to select a sample of headache sufferers to try the drug. Do you think that it is feasible to draw a simple random sample of headache sufferers, or will it be necessary to use a sample of convenience? Explain your reasoning.
- 44. Pay more for recreation?** The director of the recreation center at a large university wants to sample 100 students to ask them whether they would support an increase in their recreation fees in order to expand the hours that the center is open. Do you

think that it is feasible to draw a simple random sample of students, or will it be necessary to use a sample of convenience? Explain your reasoning.

- 45. Voter preferences:** A pollster wants to sample 500 voters in a town to ask them who they plan to vote for in an upcoming election. Describe a sampling method that would be appropriate in this situation. Explain your reasoning.
- 46. Quality control:** Products come off an assembly line at the rate of several hundred per hour. It is desired to sample 10% of them to check whether they meet quality standards. Describe a sampling method that would be appropriate in this situation. Explain your reasoning.
- 47. On-site day care:** A large company wants to sample 200 employees to ask their opinions about providing a day care center for the employees’ children. They want to be sure to sample equal numbers of men and women. Describe a sampling method that would be appropriate in this situation. Explain your reasoning.
- 48. The tax man cometh:** The Internal Revenue Service wants to sample 1000 tax returns that were submitted last year to determine the percentage of returns that had a refund. Describe a sampling method that would be appropriate in this situation. Explain your reasoning.

Extending the Concepts

- 49. Draw a sample:** Imagine that you are asked to determine students’ opinions at your school about a potential change in library hours. Describe how you could go about getting a sample of each of the following types: simple random sample, sample of convenience, voluntary response sample, stratified sample, cluster sample, systematic sample.
- 50. A systematic sample is a cluster sample:** Explain how a systematic sample is actually a type of cluster sample.

Answers to Check Your Understanding Exercises for Section 1.1

1. No; this sample consists only of people in the town who visit the mall.

2. Yes; every group of n customers, where n is the sample size, is equally likely to be chosen.
3. Voluntary response sample

4. Cluster sample

5. Stratified sample

6. Systematic sample

Section	Types of Data
1.2	<p>Objectives</p> <div><p>1. Understand the structure of a typical data set</p><p>2. Distinguish between qualitative and quantitative variables</p><p>3. Distinguish between ordinal and nominal variables</p><p>4. Distinguish between discrete and continuous variables</p><p>5. Distinguish between ratio and interval levels of measurement</p></div>

Objective 1 Understand the structure of a typical data set

Data Sets

In Section 1.1, we described various methods of collecting information by sampling. Once the information has been collected, the collection is called a **data set**. A simple example of a data set is presented in Table 1.1, which shows the major, final exam score, and grade for several students in a certain statistics class.

Comstock/Stockbyte/Getty Images

Table 1.1 Major, Final Exam Score, and Grade for Several Students

Student	Major	Exam Score	Grade
1	Psychology	92	A
2	Business	75	B
3	Communications	82	B
4	Psychology	72	C
5	Art	85	B

Table 1.1 illustrates some basic features that are found in most data sets. Information is collected on **individuals**. In this example, the individuals are students. In many cases, individuals are people; in other cases, they can be animals, plants, or things. The characteristics of the individuals about which we collect information are called **variables**. In this example, the variables are major, exam score, and grade. Finally, the values of the variables that we obtain are the **data**. So, for example, the data for individual #1 are Major = Psychology, Exam score = 92, and Grade = A.

Check Your Understanding

1. A pollster asks a group of six voters about their political affiliation (Republican, Democrat, or Independent), their age, and whether they voted in the last election. The results are shown in the following table.

Voter	Political Affiliation	Age	Voted in Last Election?
1	Republican	34	Yes
2	Democrat	56	Yes
3	Democrat	21	No
4	Independent	28	Yes
5	Republican	61	No
6	Independent	46	Yes

- a. How many individuals are there?
- b. Identify the variables.
- c. What are the data for individual #3?

Answers are on page 19.

Objective 2 Distinguish between qualitative and quantitative variables

EXPLAIN IT AGAIN

Another way to distinguish qualitative from quantitative **variables**: Quantitative variables are counts or measurements, whereas qualitative variables are descriptions.

Qualitative and Quantitative Variables

Variables can be divided into two types: qualitative and quantitative. **Qualitative variables**, also called **categorical variables**, classify individuals into categories. For example, college major and gender are qualitative variables. **Quantitative variables** are numerical and tell how much or how many of something there is. Height and score on an exam are examples of quantitative variables.

SUMMARY

- Qualitative variables classify individuals into categories.
- Quantitative variables tell how much or how many of something there is.

Example 1.11

Distinguishing between qualitative and quantitative variables

Which of the following variables are qualitative and which are quantitative?

- a. A person's age
- b. A person's place of birth

- c. The mileage (in miles per gallon) of a car
- d. The color of a car

Solution

- a. Age is quantitative. It tells how much time has elapsed since the person was born.
- b. Place is qualitative. It includes categories such as “New York,” “Atlanta,” “Denver,” and “Los Angeles.”
- c. Mileage is quantitative. It tells how many miles a car will go on a gallon of gasoline.
- d. Color is qualitative. It includes categories such as “blue,” “red,” and “yellow.”

Objective 3 Distinguish between ordinal and nominal variables

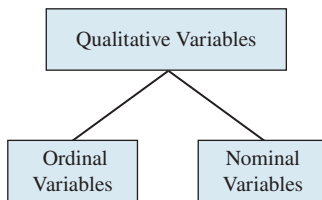

Figure 1.5 Qualitative variables come in two types: ordinal variables and nominal variables.

Ordinal and Nominal Variables

Qualitative variables come in two types: **ordinal variables** and **nominal variables**. An ordinal variable is one whose categories have a natural ordering. The letter grade received in a class, such as A, B, C, D, or F, is an ordinal variable. A nominal variable is one whose categories have no natural ordering. Gender is an example of a nominal variable. Figure 1.5 illustrates how qualitative variables are divided into nominal and ordinal variables.

SUMMARY

- Ordinal variables are qualitative variables whose categories have a natural ordering.
- Nominal variables are qualitative variables whose categories have no natural ordering.

Example 1.12

Distinguishing between ordinal and nominal variables

Which of the following variables are ordinal and which are nominal?

- a. State of residence
- b. Gender
- c. Letter grade in a statistics class (A, B, C, D, or F)
- d. Size of soft drink ordered at a fast-food restaurant (small, medium, or large)

Solution

- a. State of residence is nominal. There is no natural ordering to the states.
- b. Gender is nominal.
- c. Letter grade in a statistics class is ordinal. The order, from high to low, is A, B, C, D, F.
- d. Size of soft drink is ordinal.

Objective 4 Distinguish between discrete and continuous variables

Discrete and Continuous Variables

Quantitative variables can be either *discrete* or *continuous*. **Discrete variables** are those whose possible values can be listed. Often, discrete variables result from counting something, so the possible values of the variable are 0, 1, 2, and so forth. **Continuous variables** can, in principle, take on any value within some interval. For example, height is a continuous variable because someone’s height can be 68, or 68.1, or 68.1452389 inches. The possible values for height are not restricted to a list. Figure 1.6 illustrates how quantitative variables are divided into discrete and continuous variables.

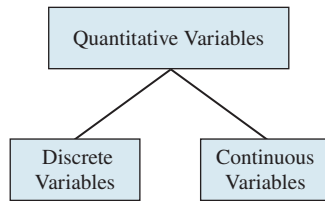

Figure 1.6 Quantitative variables come in two types: discrete variables and continuous variables.

SUMMARY

- Discrete variables are quantitative variables whose possible values can be listed. The list may be infinite—for example, the list of all whole numbers.
- Continuous variables are quantitative variables that can take on any value in some interval. The possible values of a continuous variable are not restricted to any list.

Example 1.13

Distinguishing between discrete and continuous variables

Which of the following variables are discrete, and which are continuous?

- The age of a person at his or her last birthday
- The height of a person
- The number of siblings a person has
- The distance a person commutes to work

Solution

- Age at a person's last birthday is discrete. The possible values are 0, 1, 2, and so forth.
- Height is continuous. A person's height is not restricted to any list of values.
- Number of siblings is discrete. The possible values are 0, 1, 2, and so forth.
- Distance commuted to work is continuous. It is not restricted to any list of values.

Objective 5 Distinguish between ratio and interval levels of measurement

Ratio and Interval Levels of Measurement

Quantitative variables can be categorized as having a ratio or an interval level of measurement. A variable has a **ratio level of measurement** if a value of zero indicates that none of the quantity is present, and if ratios of values of the variable are meaningful. For example, money is measured at the ratio level. An amount of \$0 represents no money. Ratios are meaningful as well: for example, \$20 is twice as much as \$10.

A variable has the **interval level of measurement** if a value of zero does not indicate that none of the quantity is present. Two commonly encountered interval variables are dates and temperature. There is no value of 0 for dates; we do not denote the beginning of time as the year 0. Similarly, when measured in °F or °C, a temperature of 0° does not indicate an absence of heat. Ratios are not meaningful for interval variables; for example, a temperature of 100° is not twice as hot as a temperature of 50°. Differences are meaningful, however; for example, the year 2030 is 10 years later than the year 2020.

SUMMARY

- A variable has the ratio level of measurement if zero represents the absence of the quantity, and ratios are meaningful.
- A variable has the interval level of measurement if zero does not represent the absence of the quantity, and ratios are not meaningful. Differences are meaningful, however.

Example 1.14

Distinguishing between interval and ratio levels of measurement

Which of the following variables are at the interval and which are at the ratio level of measurement?

- The number of siblings you have
- The outdoor temperature in °C

3. The year of the next presidential election
4. The price of a pair of shoes

Solution

- a. Ratio. Zero siblings means the absence of siblings, and 4 siblings is twice as many as 2.
- b. Interval. Temperature in °C has the interval level of measurement, because 0° does not represent the absence of heat.
- c. Interval. Dates have the interval level of measurement.
- d. Ratio. A price of \$0 indicates that the shoes cost no money, and a \$100 pair of shoes is twice as expensive as a \$50 pair of shoes.

Check Your Understanding

2. Which are qualitative and which are quantitative?
 - a. The number of patients admitted to a hospital on a given day
 - b. The model of car last sold by a particular car dealer
 - c. The name of your favorite song
 - d. The seating capacity of an auditorium
3. Which are nominal and which are ordinal?
 - a. The names of the streets in a town
 - b. The movie ratings G, PG, PG-13, R, and NC-17
 - c. The winners of the gold, silver, and bronze medals in an Olympic swimming competition
4. Which are discrete and which are continuous?
 - a. The number of female members of the U.S. House of Representatives
 - b. The amount of water used by a household during a given month
 - c. The number of stories in an apartment building
 - d. A person's body temperature
5. Which are at the interval and which are at the ratio level of measurement?
 - a. The year you started school
 - b. Your age in years
 - c. The time that your first class starts
 - d. The price of a loaf of bread

Answers are on page 19.

Section**1.2****Exercises**

Exercises 1–5 are the Check Your Understanding exercises located within the section.

Understanding the Concepts

In Exercises 6–12, fill in each blank with the appropriate word or phrase.

6. The characteristics of individuals about which we collect information are called _____.
7. The values of variables are called _____.
8. Variables that classify individuals into categories are called _____.
9. _____ variables are always numerical.
10. Qualitative variables can be divided into two types: _____ and _____.

11. A _____ variable is a quantitative variable whose possible values can be listed.

12. _____ variables can take on any value in some interval.

In Exercises 13–16, determine whether the statement is true or false. If the statement is false, rewrite it as a true statement.

13. Qualitative variables describe how much or how many of something there is.
14. A nominal variable is a qualitative variable with no natural ordering.
15. A discrete variable is one whose possible values can be listed.
16. A person's height is an example of a continuous variable.

Practicing the Skills

In Exercises 17–26, determine whether the data described are qualitative or quantitative.

17. Your best friend's name
18. Your best friend's age
19. The number of touchdowns in a football game
20. The title of your statistics book
21. The number of files on a computer
22. The waist size of a pair of jeans
23. The ingredients in a recipe
24. Your school colors
25. The makes of cars sold by a particular car dealer
26. The number of cars sold by a car dealer last month

In Exercises 27–34, determine whether the data described are nominal or ordinal.

27. The categories Strongly disagree, Disagree, Neutral, Agree, and Strongly agree on a survey
28. The names of the counties in a state
29. The shirt sizes of Small, Medium, Large, and X-Large
30. I got an A in statistics, a B in biology, and C's in history and English.
31. This semester, I am taking statistics, biology, history, and English.
32. I ordered a pizza with pepperoni, mushrooms, olives, and onions.

Working with the Concepts

51. **Popular Videos:** Following are the ten most-viewed YouTube videos, as of January 2020:

1. Despacito—Luis Fonsi featuring Daddy Yankee
2. Shape of You—Ed Sheeran
3. Baby Shark Dance—Pinkfong Kids' Songs & Stories
4. See You Again—Wiz Khalifa featuring Charlie Puth
5. Masha and the Bear: "Recipe for Disaster"—Get Movies
6. Uptown Funk—Mark Ronson featuring Bruno Mars
7. Gangnam Style—Psy
8. Sorry—Justin Bieber
9. Sugar—Maroon 5
10. Roar—Katy Perry

Source: Wikipedia

- a. Are these data nominal or ordinal?
- b. Are these data qualitative or quantitative?

52. **More Videos:** The following table presents the number of views (in millions) for the videos in Exercise 51.

Video	Number of views (millions)
1. Despacito—Luis Fonsi featuring Daddy Yankee	6610
2. Shape of You—Ed Sheeran	4600
3. Baby Shark Dance—Pinkfong Kids' Songs & Stories	4470
4. See You Again—Wiz Khalifa featuring Charlie Puth	4390
5. Masha and the Bear: "Recipe for Disaster"—Get Movies	4220
6. Uptown Funk—Mark Ronson featuring Bruno Mars	3770
7. Gangnam Style—Psy	3500
8. Sorry—Justin Bieber	3240
9. Sugar—Maroon 5	3120
10. Roar—Katy Perry	2990

Source: Wikipedia

- a. Are these data discrete or continuous?
- b. Are these data qualitative or quantitative?

33. In the track meet, I competed in the high jump and the pole vault.
34. I finished first in the high jump and third in the pole vault.

In Exercises 35–42, determine whether the data described are discrete or continuous.

35. The amount of caffeine in a cup of Starbucks coffee
36. The distance from a student's home to his school
37. The number of steps in a stairway
38. The number of students enrolled at a college
39. The amount of charge left in a phone battery
40. The number of patients who reported that a new drug had relieved their pain
41. The number of electrical outlets in a coffee shop
42. The time it takes for a text message to be delivered

In Exercises 43–50, determine whether the data described are at the interval level or the ratio level of measurement.

43. The year of your birth
44. The sales price of a car
45. The weight in pounds of a sack of potatoes
46. The score on an SAT exam (range is 200 to 800 points)
47. The water temperature, in °C, in a swimming pool
48. The number of Snapchat friends someone has
49. A student's GPA
50. The amount of data, in gigabytes, remaining on your phone

53. How's the economy? A poll conducted by the American Research Group asked individuals their views on how the economy will be a year from now. Respondents were given four choices: Better than today, Same as today, Worse than today, and Undecided. Are these choices nominal or ordinal?

54. Global warming: A recent Pew poll asked people between the ages of 18 and 29 how serious a problem global warming is. Of those who responded, 43% thought it was very serious, 24% thought it was somewhat serious, 15% thought it was not too serious, and 17% thought it was not a problem. Are these percentages qualitative or quantitative?

55. Graphic Novels: According to *Time* magazine, some of the best graphic novels of all time are:

Watchmen by Alan Moore and Dave Gibbons

Sandman by Neil Gaiman

Jimmy Corrigan, the Smartest Kid on Earth by Chris Ware

Maus by Art Spiegelman

The Adventures of Tintin: The Black Island by Hergé

Miracleman: The Golden Age by Neil Gaiman and Mark Buckingham

Fun Home: A Family Tragicomic by Allison Bechdel

The Greatest of Marlys by Lynda Berry

Are these data nominal or ordinal?

56. Watch your language: According to MerriamWebster Online, the top ten Funny Sounding and Interesting words are:

1. Bumfuzzle
2. Cattywampus
3. Gardyloo
4. Taradiddle
5. Billingsgate
6. Snickersnee
7. Widdershins
8. Collywobbles
9. Gubbins
10. Diphthong

Are these data nominal or ordinal?

57. Top ten video games: According to *Wikipedia*, the following are the top ten selling video games of all time.

Game Title	Initial Release Year	Developer	Copies Sold (millions)
1. Tetris	1984	Elektronorgtechnica	170.0
2. Minecraft	2011	Mojang	154.0
3. Grand Theft Auto V	2013	Rockstar North	100.0
4. Wii Sports	2008	Nintendo	82.9
5. PlayerUnknown's Battlegrounds	2017	PUBG Corporation	50.0
6. Pokemon Red/Green/Blue/Yellow	1996	Game Freak	47.5
7. Wii Fit and Wii Fit Plus	2007	Nintendo	43.8
8. Super Mario Bros.	1985	Nintendo	43.2
9. Mario Kart Wii	2008	Wii	37.1
10. Wii Sports Resort	2009	Nintendo	33.1

- a. Which of the columns represent qualitative variables?
- b. Which of the columns represent quantitative variables?
- c. Which of the columns represent nominal variables?
- d. Which of the columns represent ordinal variables?

58. At the movies: The following table provides information about the top ten grossing movies of all time.

Movie Title	Release Year	Studio	Ticket Sales (millions of \$)	Running Time (minutes)
1. Avengers: Endgame	2019	Disney	2797.8	182
2. Avatar	2009	Fox	2790.4	162
3. Titanic	1997	Paramount	2194.4	194
4. Star Wars: The Force Awakens	2015	Disney	2068.2	136
5. Avengers: Infinity War	2018	Disney	2048.4	160
6. Jurassic World	2015	Univision	1670.4	124
7. The Lion King	2019	Disney	1656.9	118
8. Marvel's The Avengers	2012	Disney	1518.8	143
9. Furious 7	2015	Univision	1515.0	140
10. Frozen II	2019	Disney	1420.8	103

- a. Which of the columns represent qualitative variables?
- b. Which of the columns represent quantitative variables?
- c. Which of the columns represent nominal variables?
- d. Which of the columns represent ordinal variables?

Extending the Concepts

59. What do the numbers mean? A survey is administered by a marketing firm. Two of the people surveyed are Brenda and Jason. Three of the questions are as follows:

- i. Do you favor the construction of a new shopping mall?
(1) Strongly oppose (2) Somewhat oppose (3) Neutral (4) Somewhat favor (5) Strongly favor
 - ii. How many cars do you own?
 - iii. What is your marital status?
(1) Married (2) Single (3) Divorced (4) Domestically partnered (5) Other
- a. Are the responses for question (i) nominal or ordinal?
 - b. On question (i), Brenda answers (2) and Jason answers (4). Jason's answer (4) is greater than Brenda's answer (2). Does Jason's answer reflect more of something?
 - c. Jason's answer to question (i) is twice as large as Brenda's answer. Does Jason's answer reflect twice as much of something? Explain.
 - d. Are the responses for question (ii) qualitative or quantitative?
 - e. On question (ii), Brenda answers 2 and Jason answers 1. Does Brenda's answer reflect more of something? Does Brenda's answer reflect twice as much of something? Explain.
 - f. Are the responses for question (iii) nominal or ordinal?
 - g. On question (iii), Brenda answers (4) and Jason answers (2). Does Brenda's answer reflect more of something? Does Brenda's answer reflect twice as much of something? Explain.

Design of Experiments

1.3

Objectives

1. Distinguish between a randomized experiment and an observational study
2. Understand the advantages of randomized experiments
3. Understand how confounding can affect the results of an observational study
4. Describe various types of observational studies

Objective 1 Distinguish between a randomized experiment and an observational study

Experiments and Observational Studies

Will a new drug help prevent heart attacks? Does one type of seed produce a larger wheat crop than another? Does exercise lower blood pressure? To illustrate how scientists address questions like these, we describe how a study might be conducted to determine which of three types of seed will result in the largest wheat yield.

- Prepare three identically sized plots of land, with similar soil types.
- Plant each type of seed on a different plot, choosing the plots at random.
- Water and fertilize the plots in the same way.
- Harvest the wheat, and measure the amount grown on each plot.
- If one type of seed produces substantially more (or less) wheat than the others, then scientists will conclude that it is better (or worse) than the others.

The following terminology is used for studies like this.

DEFINITION

The **experimental units** are the individuals that are studied. These can be people, animals, plants, or things. When the experimental units are people, they are sometimes called **subjects**.

In the wheat study just described, the experimental units are the three plots of land.

DEFINITION

The **outcome**, or **response**, is what is measured on each experimental unit.

In the wheat study, the outcome is the amount of wheat produced.

DEFINITION

The **treatments** are the procedures applied to each experimental unit. There are always two or more treatments. The purpose is to determine whether the choice of treatment affects the outcome.

In the wheat study, the treatments are the three types of seed.

In general, studies fall into two categories: *randomized experiments* and *observational studies*.

DEFINITION

A **randomized experiment** is a study in which the investigator assigns the treatments to the experimental units at random.

The wheat study described above is a randomized experiment. In some situations, randomized experiments cannot be performed, because it isn't possible to randomly assign the treatments. For example, in studies to determine how smoking affects health, people cannot be assigned to smoke. Instead, people choose for themselves whether to smoke, and scientists observe differences in health outcomes between groups of smokers and nonsmokers. Studies like this are called *observational studies*.

DEFINITION

An **observational study** is one in which the assignment to treatment groups is not made by the investigator.

When possible, it is better to assign treatments at random and perform a randomized experiment. As we will see, the results of randomized experiments are generally easier to interpret than the results of observational studies.

Objective 2 Understand the advantages of randomized experiments

Ingram Publishing/SuperStock

Randomized Experiments

An article in *The New England Journal of Medicine* (359:339–354) reported the results of a study to determine whether a drug called raltegravir is effective in reducing levels of virus in patients with human immunodeficiency virus (HIV). A total of 699 patients participated in the experiment. These patients were divided into two groups. One group was given raltegravir. The other group was given a placebo. (A placebo is a harmless tablet, such as a sugar tablet, that looks like the drug but has no medical effect.) Thus there were two treatments in this experiment, raltegravir and placebo.

The experimenters had decided to give raltegravir to about two-thirds of the subjects and the placebo to the others. To determine which patients would be assigned to which group, a simple random sample consisting of 462 of the 699 patients was drawn; this sample constituted the raltegravir group. The remaining 237 patients were assigned to the placebo group.

It was decided to examine subjects after 16 weeks and measure the levels of virus in their blood. Thus the outcome for this experiment was the number of copies of virus per milliliter of blood. Patients were considered to have a successful outcome if they had fewer than 50 copies of the virus per milliliter of blood. In the raltegravir group, 62% of the subjects had a successful outcome, but only 35% of the placebo group did. The conclusion was that raltegravir was effective in lowering the concentration of virus in HIV patients. We will examine this study and determine why it was reasonable to reach this conclusion.

The raltegravir study was a randomized experiment, because the treatments were assigned to the patients at random. What are the advantages of randomized experiments? In a perfect study, the treatment groups would not differ from each other in any important way except that they receive different treatments. Then, if the outcomes differ among the groups, we may be confident that the differences in outcome must have been caused by differences in treatment. In practice, it is impossible to construct treatment groups that are exactly alike. But randomization does the next best thing. In a randomized experiment, any differences between the groups are likely to be small. In addition, the differences are due only to chance.

Because the raltegravir study was a randomized experiment, it is reasonable to conclude that the higher success rate in the raltegravir group was actually due to raltegravir.

SUMMARY

In a randomized experiment, if there are large differences in outcomes among the treatment groups, we can conclude that the differences are due to the treatments.

Example 1.15

Identifying a randomized experiment

To assess the effectiveness of a new method for teaching arithmetic to elementary school children, a simple random sample of 30 first graders was taught with the new method, and another simple random sample of 30 first graders was taught with the currently used method. At the end of eight weeks, the children were given a test to assess their knowledge. What are the treatments in this study? Explain why this is a randomized experiment.

Solution

The treatments are the two methods of teaching. This is a randomized experiment because children were assigned to the treatment groups at random.

Double-blind experiments

We have described the advantages of assigning treatments at random. It is a further advantage if the assignment can be done in such a way that neither the experimenters nor the subjects know which treatment has been assigned to which subject. Experiments like this are called *double-blind* experiments. The raltegravir experiment was a double-blind experiment, because neither the patients nor the doctors treating them knew which patients were receiving the drug and which were receiving the placebo.

DEFINITION

An experiment is **double-blind** if neither the investigators nor the subjects know who has been assigned to which treatment.

Experiments should be run double-blind whenever possible, because when investigators or subjects know which treatment is being given, they may tend to report the results differently. For example, in an experiment to test the effectiveness of a new pain reliever, patients who know they are getting the drug may report their pain levels differently than those who know they are taking a placebo. Doctors can be affected as well; a doctor's diagnosis may be influenced by a knowledge of which treatment a patient received.

In some situations, it is not possible to run a double-blind experiment. For example, in an experiment that compares a treatment that involves taking medication to a treatment that involves surgery, both patients and doctors will know who got which treatment.

Example 1.16

Determining whether an experiment is double-blind

Is the experiment described in Example 1.15 a double-blind experiment? Explain.

Solution

This experiment is not double-blind, because the teachers know whether they are using the new method or the old method.

Randomized block experiments

The type of randomized experiment we have discussed is sometimes called a **completely randomized experiment**, because there is no restriction on which subjects may be assigned which treatment. In some situations, it is desirable to restrict the randomization a bit. For example, imagine that two reading programs are to be tested in an elementary school that has children in grades 1 through 4. If children are assigned at random to the programs, it is possible that one of the programs will end up with more fourth graders while the other one will end up with more first graders. Since fourth graders tend to be better readers, this will give an advantage to the program that happens to end up with more of them. This possibility can be avoided by randomizing the students within each grade separately. In other words, we randomly assign exactly half of the students within each grade to each reading program.

This type of experiment is called a **randomized block experiment**. In the example just discussed, each grade constitutes a block. In a randomized block experiment, the subjects are divided into blocks in such a way that the subjects in each block are the same or similar with regard to a variable that is related to the outcome. Age and gender are commonly used blocking variables. Then the subjects within each block are randomly assigned a treatment.

Observational Studies

Recall that an observational study is one in which the investigators do not assign the treatments. In most observational studies, the subjects choose their own treatments. Observational studies are less reliable than randomized experiments. To see why, imagine a study that is intended to determine whether smoking increases the risk of heart attack. Imagine that a group of smokers and a group of nonsmokers are observed for several years, and during that time a higher percentage of the smoking group experiences a heart attack. Does this prove that smoking increases the risk of heart attack? No. The problem is that the smoking group will differ from the nonsmoking group in many ways other than smoking, and these other differences may be responsible for differences in the rate of heart attacks. For example, smoking is more prevalent among men than among women. Therefore, the smoking group will contain a higher percentage of men than the nonsmoking group. It is known that men have a higher risk of heart attack than women. So the higher rate of heart attacks in the smoking group could be due to the fact that there are more men in the smoking group, and not to the smoking itself.

Confounding

The preceding example illustrates the major problem with observational studies. It is difficult to tell whether a difference in the outcome is due to the treatment or to some other difference between the treatment and control groups. This is known as **confounding**. In the preceding example, gender was a *confounder*. Gender is related to smoking (men are more likely to smoke) and to heart attacks (men are more likely to have heart attacks). For this reason, it is difficult to determine whether the difference in heart attack rates is due to differences in smoking (the treatment) or differences in gender (the confounder).

Objective 3 Understand how confounding can affect the results of an observational study

EXPLAIN IT AGAIN

Another way to describe a **confounder**: A confounder is something other than the treatment that can cause the treatment groups to have different outcomes.

SUMMARY

A **confounder** is a variable that is related to both the treatment and the outcome. When a confounder is present, it is difficult to determine whether differences in the outcome are due to the treatment or to the confounder.
